608 SOUTH AVENUE GARWOOD BOROUGH
UNION COUNTY, NEW JERSEY
EPA ID# NJD980530265

GENERAL INFORMATION AND SITE HISTORY

The Magnus Chemical Company (Magnus) site is located on Block 21, Lot 1 in the Borough of Garwood, Union County, New Jersey. The 3.86-acre site is located in an industrial/commercial section of Garwood and is currently a series of four buildings known as the Bell Factory Terminal. The site is bordered by South Avenue to the south, the Central Railroad Company of New Jersey to the north, industrial property (Lermer Packaging) to the east and the Garwood-Westfield Borough line to the west. The area within 1 mile of the site is highly urbanized. The nearest residential area is approximately 170 feet south of the site along Willow Avenue. The estimated population within 4.0 miles of the site is 201,500.

Block 21, Lot 1 was originally a 8.78-acre lot which included properties from 502 to 650 South Avenue in Garwood. The property is now divided into two separate lots (Lot 1 and Lot 2). Documentation suggests that Magnus's operations only occurred on this portion, Block 21, Lot 1; therefore, this report will concentrate on this portion of the original property. Lot 2 is currently occupied by Lermer Packaging and Excel Air, and is owned by ACP Partnership.

In November 1964 Economics Laboratory obtained Magnus and operated the site until 1971 when manufacturing operations ceased and the property sold to Bell Factory Terminal. On March 13, 1975 Bell Factory Terminal sold the property to ACP Trust and on October 21, 1991 ownership was transferred to ACP Partnership for $1.00.

Various operations have been conducted on site since at least 1909. Review of Sanborn Fire Insurance Maps (years 1909, 1916, 1921, 1928 and 1949) indicate that at least 10 different companies operated on site during this 40-year period. Operations depicted on site during this period include: Bell Electric Motor Company (manufacturers of motors and dynamos) 1909, 1916, 1921 Sanborn Maps; National Metallizing Company (chandeliers and statuary) 1916 Sanborn Map; Geo. C. Moon Company Incorporated (manufacturers of wire rope) 1916 and 1921 Sanborn Maps; Continuous Casting Corporation (brass manufacturers/working) 1916 and 1921 Sanborn Maps; Rodic Rubber Company (rubber goods manufacturer) 1928 Sanborn Map; Brass and Copper Tube Works Inc. (listed as "not in operation") 1928 Sanborn Map; Vendex Inc. (manufacturers of vending machines) 1928 Sanborn Map; DIF Corp-Magnus Chemical Corporation (manufacturers of washing powder) 1928 and 1949 Sanborn Map; and Bingham Bros. Company (manufacturers of metal sash and door frames) 1949 Sanborn Map.

According to the Garwood Borough librarian, a Ply Fiber Container Company may have also operated on site during the late 1930s. Also, Excel Tool & Die Company Inc. began operating as a manufacturer of tools, dies, jigs and special machinery at 628 South Avenue in December 1952. Excel Tool & Die Company Inc. is no longer on site and no information on when its operations ceased were found on file.

Lermer Packaging (aka: Loral Packaging) began operations as a manufacturer of plastic containers and injected molded articles at 502 South Avenue in January 1952. Lermer Packaging has expanded its operations over the years to other buildings on the original Block 21, Lot 1; however, documentation suggests that they have never operated on property or buildings once occupied by Magnus Chemical Corporation. Lermer Packaging underwent an Environmental Cleanup Responsibility Act (ECRA) cleanup (ECRA Case No.86117) which included the excavation of two former fuel oil underground storage tanks (USTs) and resulting contaminated soil, the abandonment of four other USTs and the installation of five monitoring wells. The case was closed under ECRA on September 10, 1991. According to a 1968 Site Map, the a Laminating Tissue Paper Company was operating in the building currently occupied by NAPA Auto Parts and Lermer Packaging.

In 1964 Economics Laboratory purchased Magnus and continued similar operations until approximately 1971 when its manufacturing equipment and aboveground tanks were removed prior to sale to Bell Factory Terminal in 1971. Since that time the site has been leased to various tenants. Currently the site consists of four buildings leased to various tenants.

During a February 9, 1990 Pre-Sampling Assessment (PSA) conducted by the NJDEP/Division of Hazardous Waste Management (DHWM)/Bureau of Planning and Assessment (BPA), a representative of ACP Trust stated that none of the current tenants generated hazardous wastes. Tenants currently on site include NAPA Auto Parts; Lermer Packaging, which occupied a building not previously occupied by either Magnus Chemical or Economics Laboratory; Brooks Equipment Co. Inc., (fire control equipment), 610 South Avenue; Townsend Bros. Moving and Storage, 612 South Avenue; New Mints (sportswear), 618 South Avenue; ICF Kaiser Engineers (environmental contractor-equipment storage), 624 South Avenue; Textiles by Peterson Inc., 632 South Avenue; Spruce Industries (sanitary products), 632 South Avenue; Apple Knoll Printers (warehouse), 632-D2 South Avenue; Team Plastics, 650 South Avenue; SpotField Productions (stage props), Gum and Pockets, Cheyenne Ceiling (interior contractor), K-Wood Working and Exxon (record storage). Other past tenants on site included North Jersey Express, Inter Innovation Inc., 628 South Avenue (off site approximately 1980) D.J. Hartnett and Company, Charter Tool Company and Triangle Tool Company.

Charter Tool Company, Inc. operated a tool and die shop at 624 South Avenue from April 28, 1981 to May 11, 1988 when operations were continued by Triangle Tool Company. This initiated an ECRA investigation (Case No.88825). During the investigation no history or evidence of spills or discharge were noted and no hazardous wastes were to remain on site. In addition, a 550-gallon #2 heating oil UST located in a paved parking area passed a tightness test on May 25, 1989. Charter Tool received a negative declaration from the NJDEP/DHWM on August 18, 1989.

SITE OPERATIONS OF CONCERN

Magnus began manufacturing industrial cleaning compounds and specialty detergents on site in 1928. Also operating within the same building was DIF Corp. which manufactured household cleaning materials. These two

companies shared the same president and vice presidents. In 1928 operations were limited to one building (the front portion of the original building noted in a 1909 Sanborn Map). In 1949 Magnus and DIF Corp. had expanded into the building now occupied by New Mints, 618 South Avenue (Bld. B See Map 2A), as well as a portion of the warehouse building (Bld. C See Map 2A) located to the west. With this expansion Magnus also began manufacturing industrial washing machines, metallic soaps, emulsifying agents and metal working lubricants. Around 1958 DIF Corp. became a subsidiary of Magnus and continued producing household cleaners as well as waterless hand cleaners. During this time the Larkin Soap Company Inc. was formed as a subsidiary of Magnus and operated within the same buildings as Magnus and DIF. On October 30, 1964 Magnus was merged into Economics Laboratory which continued producing specialty detergents and cleaning compounds. In 1971 Economics Laboratory sold the property and removed all manufacturing equipment and tanks. However, according to the 1972 issue of the New Jersey Industrial Directory, Economics Laboratory was still operating on site.

No information was found on file concerning the types of processes used in the production of the various cleaning compounds, detergents and polishes produced by Magnus and its two on-site subsidiaries or the processes continued by Economics Laboratory.

No information was found on file concerning the types of raw materials used by Magnus, DIF or Larkin Soap. Raw materials were most likely stored in tanks and drums. A May 1949 Sanborn Map shows six aboveground oil tanks and three smaller aboveground tanks of unknown contents. In addition, a drum yard was located between the northwestern portion of the original building (Bld. A) and the railroad tracks. Raw materials and products may have been transported to and from the site via rail. A railroad siding was located on site from 1909 to at least 1976.

Economics Laboratory utilized 31 above and below ground tanks for the storage of raw materials. The tanks ranged in size from 1,000 to 10,000 gallons. Tank numbers, contents and capacity as depicted in 1968 can be found below:

Tank No.	Capacity (Gallons)	Content
10	1,000	Naphthol spirits
11	5,000	46 mino spirits
12	5,000	Isophar H
17	10,000	Fuel oil No.2
18	10,000	Super Magnusol
19	10,000	Super Magnusol
20	5,000	Moodsol No.90
21	5,000	No. 798
22	5,000	Heavy aromatic naphtha
23	5,000	Heavy aromatic naphtha
24	10,000	Magnusol X-4
25	5,200	Mineral seal oil
26	5,200	215-D
27	5,000	Isopar K
30	10,000	No.755
*31	10,575	Caustic liquid potash

Tank No.	Capacity (Gallons)	Contents
33	8,000	Empty
*37	10,000	Fuel oil
*38	10,000	Cresylic acid 554
*39	10,000	Cresylic acid 554
*40	10,000	Kerosene
41	10,000	Coray 40
43	10,000	Mixing tank
44	10,000	Pine oil
45	10,000	o-dichlorobenzene
46	10,000	o-dichlorobenzene
47	9,900	Sulfuric acid
59	1,500	Fuel oil
60	3,000	Phosphoric acid
63	10,000	Caustic soda liq. 50%
65	1,200	Empty

* These underground storage tanks were removed in August 1990.

In 1971 Economics Laboratory ceased operations, the manufacturing equipment was removed and the site remodeled. During this time all aboveground storage tanks and underground storage tanks (USTs) were removed or abandoned in place. Five USTs Tanks No. 31, 37, 38, 39 and 40, were not properly abandoned. The USTs were registered with the NJDEP/Division of Water Resources (DWR)/Bureau of Underground Storage Tanks (BUST) on April 1, 1990 in preparation for their removal. The tanks were listed to contain caustic liquid potash, No.2 diesel fuel, kerosene and cresylic acid (Tank Nos. 38 and 39). On August 20, 1991 the fuel oil (diesel) tank and the kerosene tank were excavated and removed. The two cresylic acid tanks were removed on August 28, 1990 and the potash (potassium hydroxide) tank was excavated on August 29, 1990. The tanks appeared to be in good condition; however, during the excavation of the two cresylic acid tanks and the potassium hydroxide tank a representative of the NJDEP/DHWM/BPA observed areas of stained soil within the tank excavations.

No documentation was found on file concerning the types and amount of wastes generated by Magnus. In a June 5, 1981 Superfund Notification, Economics Laboratory stated that organic, inorganic and solvent wastes were generated on site, and wastes were stored in several USTs with a combined storage capacity of approximately 50,000 gallons.

No information was found on file indicating that Magnus or Economics Laboratory had held any Federal of State pollution permits. However, in a May 8, 1986 NJDEP/DWR/BUST Underground Storage Tank Registration questionnaire, ACP Trust had 21 USTs registered under UST #0085250 located at 502 to 650 South Avenue. The tanks ranged in size from 550 gallons to 6,000 gallons and contained heating oil, diesel fuel, leaded and unleaded gasoline and waste oil. Ten tanks were removed in January 1990. Currently, ACP Trust maintains five USTs at 502 to 650 South Avenue, which include a 5,000-gallon kerosene tank (E017); a 1,000-gallon hydraulic oil tank (E018); a 3,000-gallon unleaded gasoline tank (E019); and two 3,000-gallon heating oil tanks (E020 and E021).

No chemical releases have been documented from operations on site. The

potential for release from spillage due to past operations exists. A railroad siding existed on site which connected to the Central Railroad from at least 1909 and still appears on a November 4, 1968 map of the Bell Factory Terminal (See Map 2B). The siding has since been removed and almost the entire site is paved. During the removal of the two cresylic acid tanks and the potash tank on August 27 and 28, 1990 some discolored soil was noted. The stained soil was stockpiled and later disposed of off site.

GROUNDWATER ROUTE

The site is located within the Piedmont Physiographic Province and is underlain by Quaternary deposits of the Pleistocene Epoch and the Brunswick Formation of the Triassic Epoch. The Quaternary deposits within the area consists of ground maraine which is made up of unstratified and unsorted clays, sands and gravel and ranges in thickness from 0 to 100 feet. Underlying these Quaternary deposits is the Brunswick shale which consists of thin-bedded shales, mudstones and sandstones which range in color from reddish-brown to gray. The formation ranges from 6,000 to 8,000 feet thick and is the most intensely developed aquifer in the area.

Based on monitoring well borings from an ECRA investigation of Loral Packaging (located on same block and lot as Magnus), groundwater is encountered at depths of 8 to 9 feet. Groundwater flow is toward the southeast. Depth to bedrock is estimated to be 12 to 16 feet below the surface. No groundwater was encountered during the excavation of the five USTs in August 1990.

No monitoring wells have been installed in conjunction with operations conducted by either Magnus or Economics Laboratory; however, five monitoring wells have been installed in accordance with an NJDEP/Bureau of Environmental Cleanup and Responsiblilty Assessment (BEECRA) investigation of Loral Packaging Corporation (ECRA Case No.86117). Four monitoring wells were installed in July 1988. Monitoring wells MW-1 through MW-3 are near the former location of a 3,000-gallon steel fuel oil tank which was replaced by a 3,000-gallon fiberglass tank in 1986. MW-3 is located adjacent to a drainage ditch and is located in a perched water layer. MW-4 is located southwest of the tank on the opposite side of the building near a 5,000-gallon gasoline tank. MW-5 is a 2-inch diameter well located inside Building R-3 adjacent to a covered pit and a 3,000- gallon fuel oil tank. The wells range in depth from 12 feet (MW-3 and MW-4) to 17 feet (MW-1). Sampling of MW-1 to MW-4 on July 19, 1988; August 1, 1988 and December 1 and 5, 1988 revealed groundwater to be contaminated with low levels of base/neutrals (34 parts per million [ppb] MW-2) and petroleum hydrocarbons (2.4 ppm MW-2). Volatile organics were detected primarily within MW-2 (116 ppb) and MW-3 (33 ppb) with trichloroethylene being the major contaminant. Sampling of MW-5 on June 4, 1990 revealed the well to be contaminated with low levels of base/neutrals (35 ppb) and PHCs (1.8 ppm). It is Loral Packaging's contention that the volatile organic contamination in MW-1 and MW-2 is from an off-site source.

As stated, the Brunswick Formation is a major aquifer in the area and is used for both industrial and public supplies. Of the 50 public supply wells located within 4.0 miles of the site, 47 draw from the Brunswick Formation. The Elizabethtown Water Company maintains 39 wells within 4.0

miles of the site; however, only 9 wells are currently in service. The nearest wells are located 0.8, 0.9 and 1.0 mile west of the site. The wells range from 502 to 525 feet deep and draw from the Brunswick Formation; however, these three wells are currently out of service. The nearest in-service wells are Charles Avenue Well 1 and Charles Avenue Well 2 located 2.6 and 2.5 miles north of the site, respectively, within Mountainside Borough. The wells are 454 and 572 feet deep, respectively, and draw from the Brunswick Formation. The remaining seven wells are located in the Netherwood well field in Plainfield, approximately 3.7 miles southwest of the site. The wells range in depth from 300 to 500 feet and draw from the Brunswick Formation. The Elizabethtown Water Company uses groundwater wells as a supplement to its two surface water withdrawals from the Raritan River and the Delaware and Raritan Canal which supply approximately 90 percent of its water. Public supply wells operated by the Elizabethtown Water Company within 4.0 miles of the site service approximately 10,200 residents. The Elizabethtown Water Company serves approximately 502,500 residents in 44 municipalities within Union, Essex, Middlesex, Somerset and Mercer Counties.

The Rahway Water Department maintains six wells located between 3.0 and 3.3 miles southeast of the site. Wells # 1, #2, #3, #4 and #5 have been out of service since 1987; Well #6 is 269 feet deep and draws from the Brunswick Formation. The Rahway Water Department services approximately 26,600 residents within the municipalities of Rahway, Linden and Clark, of which only 4.4 percent or 1,170 residents are serviced by Well #6; the majority residents are serviced by two surface water intakes from the Rahway River (81 percent) and a bulk purchase from the Elizabethtown Water Company (14.6 percent).

The New Jersey American Water Company operates five wells located 3.8 miles north-northwest of the site in the Baltusrol well field. The wells range in depth from 300 to 462 feet deep and draw from the Brunswick Formation. These five wells serve approximately 2,960 residents. The majority of the its water (70 percent) is suppled by surface water intakes from the Passaic River and Canoe Brook as well Canoe Brook Reservoirs #1, #2 and #3. The New Jersey American Water Company serves approximately 179,000 residents within 19 municipalities located within Union, Essex, Passiac and Morris Counties.

The estimated total population utilizing groundwater within 4.0 miles for potable supplies is 14,330.

There are 27 industrial supply wells within 4.0 miles of the site, the closest being operated by Loral Packaging/Lermer Packaging, approximately 0.3 mile west of the site. The well is 300 feet deep and draws from the Brunswick Formation.

No records of either Magnus or Economic Laboratory being issued a permit for discharge to groundwater were found on file. None of the current tenants on site maintain discharge to groundwater permits. No records of release have been documented; however, there is a potential for groundwater contamination from past on-site operations. Magnus operated 31 above and below ground tanks which held various materials including mineral spirits, fuel oil, caustics, sulfuric and phosphoric acid and naphthal spirits.

SURFACE WATER ROUTE

A small brook is located approximately 500 feet south of the site, which flows parallel to South Avenue for 3,500 feet before turning northeast to join the Rahway River located 1.4 miles downstream of the site.

Storm waters from the site are collected via on-site storm drains as well as storm drains located along South Avenue. The storm waters are discharged to the small brook approximately 2,000 feet downstream of the site.

The Rahway River flows southeast for approximately 12 miles before entering the Arthur Kill which continues southeast to form the New Jersey-New York boundary.

The Rahway River in the area of the site is classified as FW2-NT. Designated uses include the maintenance of established biota, primary and secondary contact recreation, industrial water supply and public water supply after treatment. The Rahway River receives 53 industrial, commercial and municipal NJPDES permitted discharges. The Arthur Kill is classified as SE-2 water and is used for industrial, commercial and recreational purposes.

The Rahway Water Department obtains approximately 81 percent of its potable water supply via a surface water withdrawal from the Rahway River, located approximately 6.9 miles downstream of the site, and serves approximately 21,500 residents within the municipalities of Rahway, Linden and Clark.

No documentation was found indicating if Magnus or Economics Laboratory held NJPDES permits for discharge to surface water. There is a potential for surface water contamination if spills or contaminated runoff entered storm drains and subsequently discharged to the small brook.

Riverine, lower perennial wetlands associated with the Rahway River are located approximately 1.9 miles downstream of the site. Other wetlands associated with the Rahway River include palustrine open water, palustrine scrub/shrub and palustrine forested wetlands. Estuarine wetlands appear approximately 9 miles downstream of the site and include estuarine subtidal open water and estuarine intertidal emergent wetlands.

According to the National Hertiage Index Maps there are no areas of threatened or endangered species along the surface water pathway route. However the bog turtle, Clemmys muhlenbergii, is associated with habitats similar to areas found within the Roselle Quadrangle.

AIR ROUTE

No records of air sampling being conducted due to on-site operations were found on file. In addition, no records of inspections or complaints of air release were found on file. The current potential for air contamination is low. No large-scale manufacturing occurs on site and none of the current tenants maintain air pollution permits.

SOIL

Well logs completed on the Loral Packaging area have indicated soils

consist of dark gray clay which changes to red-brown sandy clay with intermittent gravel and cobbles at a depth of approximately 10 feet. During the excavation of the potassium hydroxide tank, surfical soil consisted of 1 to 2 feet of light gray gravel fill. During the August 27 and 28, 1990 underground tank excavations, approximately 8 cubic yards of discolored soil was stockpiled and covered with plastic. One soil sample was collected from the stockpiled soil on December 17, 1990 and underwent Toxic Compound Leaching Procedure (TCLP) analysis for metals, volatiles, base/neutrals and pesticides as well as petroleum hydrocarbon (PHC) analysis. PHCs were detected at 860 ppm which is above the 100 ppm NJDEP action level. The soil was classified as a RCRA non-hazardous material and disposed of off site.

DIRECT CONTACT

No incidences of direct contact with wastes on site have been documented. According to the president of ACP Trust, none of the current tenants use or generate hazardous materials. Loral Packaging uses solvents (toluene), lacquers and print pigments in their plastic container manufacturing and labeling operations. The potential for direct contact with wastes on site is low. During a February 9, 1990 NJDEP/DHWM/BPA Pre-Sampling Assessment (PSA) it was noted that the majority of the site is paved, and no wastes or drums were observed on site. The site is not fenced, allowing access by the public.

FIRE AND EXPLOSION

No reported incidents of fire or explosion were found on file. Currently, the potential exists because Loral Packaging uses flammable solvents (toluene) and lacquers and thinners in their operations.

ADDITIONAL CONSIDERATIONS

The site is located in a industrial area of Garwood and is almost entirely paved. No records of damage to flora and fauna were found on file and there is little potential of such damage occurring. During past operations potentially contaminated runoff could have entered site and local storm drains which discharge to a small brook which flows southeast of the site. No records of damage to off-site property were found on file. There is little potential for contamination of the food chain from operations on site.

ENFORCEMENT ACTIONS

No records of enforcement actions against Magnus or Economics Laboratory were found on file; however, due to the fact that their operations ceased in 1971, any records may have been destroyed.

SUMMARY OF SAMPLING DATA

1. Sampling date: December 17, 1990

   Sampled by: Environmental Waste Management Associates
   200 Maltese Drive
   Totowa, New Jersey

   Sample: One soil sample

Laboratory:	Integrated Analytical Laboratories Inc. 150 Railroad Avenue Paterson, New Jersey New Jersey Laboratory Certification #16751
Parameters:	Toxic Compounds Leaching Procedure (TCLP) metals, volatile compounds, semivolatiles, pesticides and PHCs
Sample description:	One waste classification sample (WC-1) was collected from soil stockpiled during the excavation of five underground storage tanks in August 1990.
Contaminants detected:	Arsenic, cadmium, lead and selenium were detected at 0.0005 ppm, 0.06 ppm 0.10 ppm and 0.0005 ppm, respectively. All these levels were below the maximum concentration for EP toxicity characteristics. No volatile organics, pesticides or PCBs were detected. Only one semivolatile was detected; 1,4-dichlorobenzene was detected at 4 ppb. PHCs were detected at 860 ppm which is above the 100 ppm NJDEPE action level.
QA/QC:	All NJDEP protocol was followed. No trip or field blanks were utilized. Intergrated Analytical Laboratories, Inc. is a New Jersey certified laboratory.
File location:	Attachment U NJDEPE/DRPSR/BSA 300 Horizon Center Robbinsville, New Jersey

RECOMMENDATIONS AND CONCLUSIONS

Magnus manufactured cleaning compounds and industrial detergents from 1928 until approximately 1964 when Economics Laboratory took over its operations. Economics Laboratory continued operations until approximately 1971. All manufacturing equipment and above and below ground tanks used by Magnus/Economics Laboratory were either removed or abandoned in place. No records of spills were found on file; however, the potential for spills from past operations exists. Currently the site is leased to various tenants which do not generate hazardous wastes. The site is almost entirely paved and no wastes were observed to be stored outside any of the buildings.

In August 1990 five USTs which were utilized by Economics Laboratory and not removed in 1971 were excavated. The tanks appeared in good condition; however, some soil staining was noted within the excavations. The stained soil was removed and the excavations filled in with clean fill. A soil sample collected from the stockpiled soil contained PHCs above the NJDEPE action level.

No further action under CERCLA is recommended at this time. The case will be transferred to the NJDEPE, Bureau of Metro Field Operations for additional investigation. Soil samples should be collected around the five USTs excavated in August 1990 to determine if past spills contaminated surrounding soil.

△ — INDUSTRIAL WELL YIELD OVER 70 GALLONS PER MINUTE (INCLUDING PRIVATE WELLS)

□ — PUBLIC SUPPLY WELL YIELDING OVER 70 GALLONS PER MINUTE

⊕ — UNSUCCESSFUL ROCK WELL YIELDING LESS THAN 70 GALLONS PER MINUTE

⊙ — UNSUCCESSFUL SAND WELL YIELDING LESS THAN 70 GALLONS PER MINUTE

⊡ — NO TEST — NO DATA ON YIELD

——— FAULT (DASHED WHERE INFERRED)

——— CONTACT (DASHED WHERE INFERRED)

PHYSIOGRAPHIC PROVINCE BOUNDARY

WATER SUPPLY TRANSMISSION LINE

NOTE: WHERE THE PRECAMBRIAN FORMATION BOUNDARIES TERMINATE ABRUPTLY, IT IS THE GEOLOGIST'S OPINION THAT THE GEOLOGICAL COMPLEXITY OF THE AREA PREVENTS FURTHER INTERPRETATIONS.

Kmr — CRETACEOUS MAGOTHY AND RARITAN FORMATIONS (SAND AND CLAY)

$\overline{R}$b — TRIASSIC BRUNSWICK FORMATION

$\overline{R}$c — TRIASSIC CONGLOMERATE BEDS OF THE STOCKTON FORMATION

$\overline{R}$l — TRIASSIC LOCKATONG FORMATION

$\overline{R}$db — TRIASSIC DIABASE

$\overline{R}$bs — TRIASSIC BASALT FLOWS

Sd — SILURIAN DECKER LIMESTONE AND LONGWOOD SHALE FORMATIONS

Sgp — SILURIAN GREEN POND CONGLOMERATE

Omb — ORDOVICIAN MARTINSBURG SHALE

$\overline{\text{eOk}}$ — CAMBRO ORDOVICIAN KITTATINNY LIMESTONE

$\overline{\text{e}}$h — CAMBRIAN HARDYSTON SANDSTONE

PRECAMBRIAN:

gh - HORNBLENDE GRANITE WITH PYROXENE GRANITE

ga - ALASKITE

am - AMPHIBOLITE

px - PYROXENE GNEISS

gnq - QUARTZ PLAGIOCLASE GNEISS

gnb - BIOTITE GNEISS

sk - SKARN, GRAPHITE SCHIST

fnd — FORMATION NOT DETERMINED

MAP-7

A. Chatham, Roselle

B. Arthur Kill-Rahway; Passaic-Upper Passaic; Raritan-Lower Raritan

C. 1. Watchung - Recording precipitation gauge

2.

Map No.	Location	Period of Record
11	Passaic River near Chatham	1903-1911, 1937-
76	Robinson's Branch Rahway River nr. Goodmans	1921-1924

Water Quality Standards: (explained in Atlas Sheet description)
FW2 except where FW3

D. Brunswick Formation (Trb), Diabase (Trdb)

E. 1. Physiographic Province: Piedmont
Subdivision: Triassic Lowlands
Major Topographic Features: Wisconsin Terminal Moraine, Red Sandstone Plain, Watchung Ridges, Passaic Valley
Elevations (ft.above sea level): ridges 500, valleys 200
Relief (ft.): 350

2. a. Normal Year: 49"
Dry Year: 43"
Wet Year: 56"

b. January: 30°F
July: 73°F

c. 240 days. Last killing frost: 4/25; first killing frost: 10/15

3. a. About 70% urban or suburban. Areas of Harding, Chatham, Chatham Boro, Passaic, Warren, Watchung, North Plainfield, Berkeley Heights, New Providence, Summit, Scotch Plains, Mountainside, Springfield, Plainfield, Fanwood, Westfield, and Millburn are included.
b. Limited to small farms N.W. of the Great Swamp.
c. About 40% oak forest. Primarily on Watchung Ridges and in Great Swamp.
d. Concentrated along C.R.R.N.J., Erie-Lackawanna, and U.S. 22. Bell Telephone Murray Hill Center.
e. Traprock (Watchung, Springfield)
f. Interstate 78, U.S.22, N.J.28, N.J.24, C.R.R.N.J., Erie-Lackawanna, Rahway Valley.

A. Elizabeth, Roselle

B. Arthur Kill-Morses Creek, Rahway, Elizabeth

C. 1. Cranford - Non-recording temperature and precipitation gauges
Springfield - Recording precipitation gauge

2.

Map No.	Location	Period of Record
68	Elizabeth River at Nye Ave., Irvington	7/23/38
69	Elizabeth River at Lyons Ave., Irvington	7/23/38
70	Elizabeth River at York Ave., Irvington	7/23/38
71	Elizabeth River at Chancellor Ave., Irvington	7/23/38
73	West Branch Rahway River at Millburn	1938,1940-1950
74	Rahway River near Springfield	1938-

Water Quality Standards: (explained in Atlas Sheet description)
FW2 except where classified FW3

D. Brunswick Formation (Trb), Basalt Flows (Trbs)

E. 1. Physiographic Province: Piedmont
Subdivision: Triassic Lowlands
Major Topographic Features: Wisconsin Terminal Moraine, Red Sandstone Plain
Elevations (ft.above sea level): ridges 500, valleys 50
Relief (ft.): 450

2. a. Normal Year: 47"
Dry Year: 39"
Wet Year: 55"
b. January: 32°F
July: 74°F
c. 242 days. Last killing frost: 4/20; first killing frost: 10/20

3. a. About 75% is urban or suburban. Areas of Clark, Cranford, Elizabeth, Hillside, Irvington, Millburn, Springfield, Union, Westfield are included.
b. Agricultural production is not a significant land use.
c. About 15% covered by oak forest. Forested areas primarily within the Watchung Reservation, South Mountain Reservation, and Rahway River Park System.
e. Traprock from quarries in Springfield.
d. Garden State Parkway, U.S.22, N.J.28, N.J.24, and N.J.527.
Railroads - Lehigh Valley, Penn Central, Central Railroad of New Jersey, Erie-Lackawanna, Rahway Valley

F. Essex County:
South Mountain Reservation
Union County:
Lenape Park
Rahway River Parkway
Galloping Hill Park and Golf Course
Warinanco Park
Short Hills Water Company:
Private Watershed

H. First Presbyterian Congregation of Connecticut Farms, Union

ATTACHMENT A-2

SCHEDULE A

FIRST TRACT: BEGINNING at a point in the southerly right of way line of the Central Railroad of New Jersey said point being also the easterly line of lands of the late Chauncey B. Ripley; Thence South 5° 50' East and at right angles to the Central Railroad of New Jersey 200 feet to a stake in the division line of lands of the parties of the first part hereto and lands now or formerly of Hannah Randolph; thence still along the line of lands of Hannah Randolph South 46° 45' East 34.8 feet to a point in lands of parties of the first part, and of Hannah Randolph; thence still along the line of lands of Hannah Randolph South 44° 15' West 100 feet more or less to the North line of South Avenue, as now used and laid out; Thence Easterly along the North line of South Avenue 790 feet more or less to a point distant 300 feet at right angles from the Central Railroad of New Jersey; Thence at right angles to South Avenue and in a Northerly direction 230 feet to a point distant 70 feet from the Southerly right of way line of the Central Railroad of New Jersey; Thence North 45° East 99 feet to the southerly right of way line of the Central Railroad of New Jersey; thence westerly along the same 810 feet to the point or place of BEGINNING.

SECOND TRACT: BEGINNING at a point in the Northerly side of South Avenue, and in the division line between lands now or formerly of The Garwood Land and Improvement Company, of the Town of Garwood in the County of Union and State of New Jersey, and lands conveyed to The Hercules Seamless Drawn Tube Company by said The Garwood Land and Improvement Company of the Town of Garwood, in the County of Union and State of New Jersey, by Deed dated May 24, 1898; Thence (1) Eastwardly along said Northerly side of South Avenue 260 feet to a point; Thence (2) Northwardly at right angles to said South Avenue 300 feet to the division line between lands now or formerly of the Garwood Land and Improvement Company of the Town of Garwood, in the County of Union and State of New Jersey, and the Central Railroad Company of New Jersey; Thence (3) Westwardly along said division line between lands now or formerly of the Garwood Land and Improvement Company of the Town of Garwood, in the County of Union and State of New Jersey, and the Central Railroad Company of New Jersey, 176 feet more or less to a point in the line of lands which were conveyed by The Garwood Land and Improvement Company of the Town of Garwood, in the County of Union and State of New Jersey, to the Hercules Seamless Drawn Tube Company, by Deed dated May 24, 1898 as aforesaid; Thence (4) along said line of lands conveyed as aforesaid South 45° West 99 feet to a point; Thence (5) Southwardly still along said line of lands conveyed as aforesaid and at right angles to said South Avenue 230 feet to the place of BEGINNING.

THIRD TRACT: BEGINNING at a point in the Southerly line of the right of way of the Central Railroad of New Jersey, distant 50 feet southerly at right angles from the monumented center line of said Railroad and in the westerly line of lands conveyed by the parties of the first part to Strang Gas - Electric Car Company by Deed dated August 14, 1909; running thence southerly along the lands conveyed by the parties of the first part to the Strang Gas - Electric Car Company as aforesaid 300 feet to a point in the Northerly side of South Avenue as laid down on the map entitled "Amended Map of Garwood Land and Improvement Company's new Town Side Garwood" filed January 31, 1900 in the office of the Clerk of the County of Union under file No. 100; Thence westerly along said northerly side of South Avenue 275 feet more or less to the lands formerly of Susan S. Johnson; Thence Northerly parallel with the first course and along the said lands formerly of Susan S. Johnson 300 feet to the southerly line of the right of way of the Central Railroad of New Jersey; Thence Easterly along said Southerly line of the right of way of the Central Railroad of New Jersey, 275 feet more or less to the point or place of BEGINNING.

FOURTH TRACT: BEGINNING at an iron monument in the South Right of Way line of the Central Railroad Company of New Jersey, at the west corner of land now or formerly of the Powers and Robinson Foundry and Machine Company, said point being the Northeast corner of the tract of land conveyed to H. C. Lockwood by Deed dated July 14, 1909 from William S. Welch, Trustee, etc., et al, recorded July 16, 1909 in Deed Book 529/223; Thence along said right of way line South 79° 52' West 160 feet; Thence at right angles to said Right of Way line South 10° 08' East 300 feet to the North line of South Avenue; Thence along the North side line of South Avenue North 79° 52' East 102.13 feet to west line of land now or formerly of the Powers & Robinson Foundry and Machine Company; Thence along said land North 37° 31' East 110.66 feet to an iron monument; Thence still along said land North 53° 22' West 34.93 feet; Thence still along said land North 10° 08' West 200 feet to BEGINNING.

FIFTH TRACT: (1) BEGINNING at the intersection of the southerly line of North Avenue with the easterly side of Maple Street, and running thence (1) Eastwardly along the said southerly side line of North Avenue 300 feet to the line of lands conveyed by Christopher W. Le Valley and wife to the Garwood Bronze & Iron Works by Deed dated June 2, 1909 and recorded in Book 526 of Deeds for Union County at page 333; thence (2) Southwardly and at right angles to said side line of North Avenue and binding on said last mentioned lands 200 feet, more or less, to the northerly side of the right of way of the Central Railroad of New Jersey, thence (3) westwardly along said right of way and binding thereon 300 feet to the said side line of Maple Street; and thence (4) northwardly along said side line of Maple Street; 200 feet more or less to the point and place of BEGINNING.

(2) BEGINNING in the southerly side line of North Avenue at the east corner of lands so as aforesaid conveyed by Christopher W. Le Valley and wife to the Garwood Bronze & Iron Works, said point being 600 feet easterly along said side line of North Avenue from the easterly side line of Maple Street, and running thence (1) eastwardly along the said southerly side line of North Avenue 165 feet to a point in a direct line with the westerly side of Center Street as laid out on the southerly side of the Central Railroad of New Jersey; thence (2) southwardly in range with said westerly side of Center Street 200 feet, more or less, to the northerly right of way line of the Central Railroad of New Jersey, thence (3) westwardly along said northerly right of way line of the Central Railroad of New Jersey, parallel with and distant 200 feet, more or less, southerly at right angles from the southerly side of North Avenue 165 feet to the line of said lands so as aforesaid conveyed to the Garwood Bronze & Iron Works; thence (4) northwardly along said last mentioned lands and binding thereon 200 feet more or less to the point and place of BEGINNING.

Together with all right, title and interest which the said Christopher W. Le Valley reserved to himself and his heirs and assigns, in and by a certain deed made by Christopher W. Le Valley and wife to the Garwood Bronze & Iron Works, dated June 2, 1909 and recorded in Book 526 of Deeds for Union County, New Jersey, at page 333.

SIXTH TRACT: All those certain lots, tracts or parcels of land and premises hereinafter particularly described, situate, lying and being in the Borough of Garwood, in the County of Union and State of New Jersey, and known, shown and described on a certain map made by Edwin S. Voorhis, C.E., in August, 1909 and filed in the Office of the Register of Union County at Elizabeth, N.J., entitled, "Section No. 1, property situated at Garwood - Westfield, Union County, New Jersey, belonging to the New York Suburban Land Company" as and by the numbers as follows: Block 1-Lots 251 and 252.

ATTACHMENT A-4

Promises by Grantor. The Grantor promises that the Grantor has done no act to encumber the property. This promise is called a "covenant as to grantor's acts" (N.J.S.A. 46:4-6). This promise means that the Grantor has not allowed anyone else to obtain any legal rights which affect the property (such as by making a mortgage or allowing a judgment to be entered against the Grantor).

Signatures. The Grantor signs this Deed as of the date at the top of the first page.

(1) PARTY OR LEGAL REPRESENTATIVE (See Instructions #3, 4 and 5 on reverse side)

Deponent, JAMES C. CONLON, ESQ. (Name), being duly sworn according to law upon his/her oath deposes and says that he/she is the Legal Representative, (State whether Grantor, Grantee, Legal Representative, Corporate Officer, Officer of Title Co. Lending Institution, etc.)

in a deed dated October 21, 1991, transferring real property identified as Block No. 28, Lot 4; Blk. 1, L.8 Blk. 28, L. 1; Blk. 21, L.1; & Blk.28, L. 1.A on Tax Maps of Garwood, NJ and xxxx Blk. 503, L.13xxxxx on Tax Maps of Westfield, NJ; known as 423 North Ave. 561 South Ave., 477 North Ave., 502-650 South Ave. and 475 North Ave. respectively in Garwood, NJ & 461-469 South Ave. East, in Westfield, NJ (Street Address, Municipality, County) all in Union County, NJ. which is annexed hereto.

(2) CONSIDERATION (See Instruction #6)

Deponent states that, with respect to deed hereto annexed, the actual amount of money and the monetary value of any other thing of value constituting the entire compensation paid or to be paid for the transfer of title to the lands, tenements or other realty, including the remaining amount of any prior mortgage to which the transfer is subject or which is to be assumed and agreed to be paid by the grantee and any other lien or encumbrance thereon not paid, satisfied or removed in connection with the transfer of title is $ 1.00

(3) FULL EXEMPTION FROM FEE Deponent claims that this deed transaction is fully exempt from the Realty Transfer Fee imposed by c.49, P.L. 1968, for the following reason(s): Explain in detail. (See Instruction #7.) Mere reference to exemption symbol is not sufficient.

(a) Consideration is less than $100.00 & (j) Distribution of a Trust established by a parent to three children who formed a partnership consisting of the same three children..

(4) PARTIAL EXEMPTION FROM FEE *NOTE: All boxes below apply to grantor(s) only. ALL BOXES IN APPROPRIATE CATEGORY MUST BE CHECKED. Failure to do so will void claim for partial exemption. (See Instructions #8 and #9)*

Deponent claims that this deed transaction is exempt from the increased portion of the Realty Transfer Fee imposed by c.176, P.L. 1975 for the following reason(s):

a) SENIOR CITIZEN (See Instruction #8)
☐ Grantor(s) 62 yrs. of age or over.*
☐ One or two-family residential premises
☐ Owned and occupied by grantor(s) at time of sale.
☐ No joint owners other than spouse or other qualified exempt owners.

b) BLIND (See Instruction #8)
☐ Grantor(s) legally blind.*
☐ One or two-family residential premises.
☐ Owned and occupied by grantor(s) at time of sale.
☐ No joint owners other than spouse or other qualified exempt owners.

DISABLED (See Instruction #8)
☐ Grantor(s) permanently and totally disabled.*
☐ One or two-family residential premises.
☐ Receiving disability payments.
☐ Owned and occupied by grantor(s) at time of sale.
☐ Not gainfully employed.
☐ No joint owners other than spouse or other qualified exempt owners.

*IN THE CASE OF HUSBAND AND WIFE, ONLY ONE GRANTOR NEED QUALIFY.

c) LOW AND MODERATE INCOME HOUSING (See Instruction #8)
☐ Affordable According to H.U.D. Standards.
☐ Meets Income Requirements of Region.
☐ Reserved for Occupancy.
☐ Subject to Resale Controls.

d) NEW CONSTRUCTION (See Instruction #9)
☐ Entirely new improvement.
☐ Not previously used for any purpose.
☐ Not previously occupied.

Deponent makes this Affidavit to induce the County Clerk or Register of Deeds to record the deed and accept the fee submitted herewith in accordance with the provisions of c. 49, P.L. 1968.

Subscribed and Sworn to before me this 21, day of October, 19 91

MAGNUS CHEMICAL COMPANY
608 SOUTH AVENUE
GARWOOD BORO, UNION COUNTY, NJ 07027
EPA ID NO. NJD980530265

The Magnus Chemical Company began operations at 608 South Avenue, Garwood Boro, Union County, New Jersey in approximately 1939. The company manufactured specialty detergents and industrial cleaning compounds. Magnus was acquired by Economics Laboratory Inc. of St. Paul, Minnesota in 1964. In 1971 the facility was closed, the manufacturing equipment was removed and the site was remodeled. According to the facility's Notification of Hazardous Waste Sites Form (USEPA Form 8900-1), hazardous wastes, including organics, inorganics and solvents were stored on site in underground storage tanks. The specific chemicals and the processes used could not be determined from this investigation because so little information exists on file and because numerous telephone calls to Economics Laboratory, Inc. offices failed to reveal which office had managed the site.

The site is located in a small industrial complex known as Bell Factory Terminal. The surrounding area is commercial and densely populated residential. Bell Factory Terminal consists of several buildings housing a variety of businesses. Number 608 South Avenue is currently a vacant office located within a large building. North Jersey Express Trucking Company (610 South Ave.) and Charter Tool Company (624 South Ave.) are also located in the building. Apparently the building was subdivided after Magnus was closed. It could not be determined if Magnus had occupied the other buildings in the complex also.

According to the facility's Notification of Hazardous Waste Sites Form (USEPA Form 8900-1), hazardous wastes were stored in several underground storage tanks with a combined storage capacity of approximately 50,000 gallons. The tanks may have contained caustic liquid potash, fuel oil, gresylic acid and kerosene. There were no documented releases from these tanks. The tanks were never pressure tested or visually checked for leaks so the potential exists per soil and ground water contamination. The tanks were supposedly filled with sand during the renovation in 1971.

There are no chemical releases documented at the site, but because Magnus Chemical Company had existed before the implementation of environmental regulations, the potential exists that poor chemical handling practices may have resulted in releases to the soil and groundwater.

A railroad siding exists to the north of the property that connects with and parallels the active Conrail tracks. The siding is no longer in use at the site, but was probably used in the past to ship raw materials and products. The siding is not paved, as is the rest of the site, and again based on the age of the company, the potential exists that poor chemical handling practices may have resulted in releases to the soil and groundwater.

ATTACHMENT C-1

Site specific hydrogeological data is unavailable, but based upon a review of USGS maps and charts it was determined that the hydrogeology of the area is characterized by two zones of saturation, an unconsolidated water bearing zone occurring in 17 to 37 feet of glacial deposits, and a regional groundwater system. The regional groundwater system, the Brunswick Formation consists of fractured shale bedrock with a high secondary porosity. The two zones may be hydraulically connected, with the unconsolidated zone acting to recharge the bedrock aquifer. Groundwater in the unconsolidated zone most likely flows to the northwest. Depth to groundwater is unknown. The Rahway River is located approximately 1.5 miles to the east.

Potable water is provided by the Elizabethtown Water Company. The water company operates two well fields, the Hummock Well Field and the Springfield Well Field, located in Union Township, both within three miles of the Magnus Site. The wells draw water from the Brunswick Formation.

Because the potential existed for chemical spillage, and because of the limited information available on the site, the Magnus Chemical Company has been assigned a Medium priority for Site Inspection (SI). However, the SI has already been conducted by NUS Corporation for USEPA on March 14, 1983. The SI assigned the site a medium priority for further action because of the unknown status of the underground storage tanks.

To properly delineate any contamination that may exist on site, a soil boring and analysis program should be initiated, focusing on the railroad siding and underground storage tanks. The soil samples should be analyzed for full priority pollutant parameters. Then, depending on the results of the soil sampling program, the ground water should be analyzed for the same parameters.

NUS

POTENTIAL HAZARDOUS WASTE SITE

EXECUTIVE SUMMARY

Magnus Chemical Co.	NJD980530265
Site Name	EPA Site ID Number
605 South Avenue Garwood, NJ 07027	02-8301-34
Address	TDD Number

Date of Site Visit: 3/4/83

SITE DESCRIPTION The site is currently a subleased warehouse with various tenants. None of the tenants handle or store hazardous wastes. The facility was the location of Magnus Chemical Company from 1939-1971, and manufactured specialty detergents and industrial cleaning compounds. During these years of operation, there were 31 above and below ground storage tanks on site. In 1971 the property was sold and renovated. The renovation included elimination of all the storage tanks with the exception of four or five underground tanks.

PRIORITY FOR FURTHER ACTION: High___ Medium_x_ Low___

RECOMMENDATIONS

Since the contents and integrity of the underground storage tanks is not known, the potential for groundwater contaminatio exists. It is recommended that the existing tanks be sampled, and the tanks structural integrity be determined.

Prepared by: Mark J. O'Neill Date: April 20, 1983
of NUS Corporation

04 NARRATIVE DESCRIPTION

No recorded history. Potential cannot be discounted without knowing the integrity and contents of the underground storage tanks.

01 [X] G. DRINKING WATER CONTAMINATION — 02 [ ] OBSERVED (DATE: _____) — [X] POTENTIAL — [ ] ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 27,000
04 NARRATIVE DESCRIPTION

Potential cannot be discounted without knowing contents and integrity of underground storage tanks. The nearest community well is 2 miles to the NW. The nearest industrial well is 0.5 miles to the east along South Ave.

01 [ ] H. WORKER EXPOSURE/INJURY — 02 [ ] OBSERVED (DATE: _____) — POTENTIAL — [ ] ALLEGED
03 WORKERS POTENTIALLY AFFECTED: _____
04 NARRATIVE DESCRIPTION

No recorded history.

01 [X] I. POPULATION EXPOSURE/INJURY — 02 [ ] OBSERVED (DATE: _____) — [X] POTENTIAL — [ ] ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 27,000
04 NARRATIVE DESCRIPTION

Without knowing the content and condition of the underground storage tanks, the potential for groundwater contamination cannot be discounted. The surrounding area is serviced by Elizabethtown Water Co. which draws 4/5 of the daily usage from a pumping station along the Raritan River in Bound Brook. 1/5 of the daily water usage is drawn from various ground-water wells.

POTENTIAL HAZARDOUS WASTE SITE
SITE INSPECTION REPORT
PART 3 - DESCRIPTION OF HAZARDOUS CONDITIONS AND INCIDENTS

I. IDENTIFICATION
01 STATE: NJ | 02 SITE NUMBER: D980530265

II. HAZARDOUS CONDITIONS AND INCIDENTS (Continued)

01 ☐ J. DAMAGE TO FLORA — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

No recorded history, no potential exists. Potentially hazardous material is contained in four or five underground storage tanks.

01 ☐ K. DAMAGE TO FAUNA — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION (Include name(s) of species)

No recorded history, no potential exists. Potenially hazardous material is contained in 4 or 5 underground storage tanks.

01 ☐ L. CONTAMINATION OF FOOD CHAIN — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

No recorded history; no potential exists.

01 ☒ M. UNSTABLE CONTAINMENT OF WASTES (Spills, Runoff, Standing liquids, Leaking drums) — 02 ☐ OBSERVED (DATE: _____) ☒ POTENTIAL ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 27,000
04 NARRATIVE DESCRIPTION

The integrity and content of existing underground storage tanks are not known. The tanks were installed sometime between 1939-1964.

01 ☐ N. DAMAGE TO OFFSITE PROPERTY — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

None observed, no recorded history.

01 ☒ O. CONTAMINATION OF SEWERS, STORM DRAINS, WWTPs — 02 ☐ OBSERVED (DATE: _____) ☒ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Surface runoff does enter the storm sewers which are located in the site.

01 ☐ P. ILLEGAL/UNAUTHORIZED DUMPING — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

No recorded history; potential does exist due to the fact that the property is easily accessable. Warehouses on site are locked and equipped with security systems.

05 DESCRIPTION OF ANY OTHER KNOWN, POTENTIAL, OR ALLEGED HAZARDS

None

III. TOTAL POPULATION POTENTIALLY AFFECTED: 27,000

IV. COMMENTS

The site was the location of Magnus Chemical Co. which operated from 1939-1964. In 1964, Magnus Chemical was acquired by Economics Laboratory of St. Paul Minnesota. Economics Laboratory operated the facility from 1964 to 1971 for the manufacturing of specialty detergents and industrial cleaning compounds. During this time there were approximately 31 (see attached sheet)

EPA FORM 2070-13 (7-81)

ATTACHMENT D-5

Part 3 - Description of Hazardous Conditons and Incidents

IV. Comments: (continued)

Storage tanks, both above and below ground. The capacities of these tanks ranged from 1000 gallons to 10,000 gallons. The contents of these tanks were of various natures. In 1971, Economics Laboratory dissolved Magnus Chemical Company, and sold the property to the Bell Factory Terminal, Garwood, NJ.
According to Charles Piscitelli, who worked for the Bell Factory terminal on the renovation of 608 South Avenue in 1971, all of the tanks on the property except four or five of the underground storage tanks were removed. In 1975, 608 South Avenue was sold by the Bell Factory terminal to ACP Trust. The site is currently owned by ACP Trust and subleased to various companies. None of the current tennant's handle or store any hazardous materials other than fuel oil. Four or five underground storage tanks still remain on the site. According to Charles Piscitelli, Warehouse Manager for ACP Trust, the integrity and content of these four or five underground tanks are not known. There were no above ground tanks or drums observed during the NUS FIT II Site Inspection, 3/4/83.

and services were started under the pastorate of Rev. Herman Retter. At first services were held only in German, but more recently, because of the influence of the young people, a change was made and now the Sunday School is conducted entirely in English and services on the first, third and fifth Sundays in English, on the second and fourth Sundays in German. Rev. Karl Schauer followed Mr. Ritter as pastor; Rev. W. Petersman followed Mr. Schauer, and Rev. Paul Lehmann, the present pastor, succeeded Mr. Petersman. At first the church had a struggle to make ends meet but is now on a good financial footing and has greatly enlarged and beautified the building.

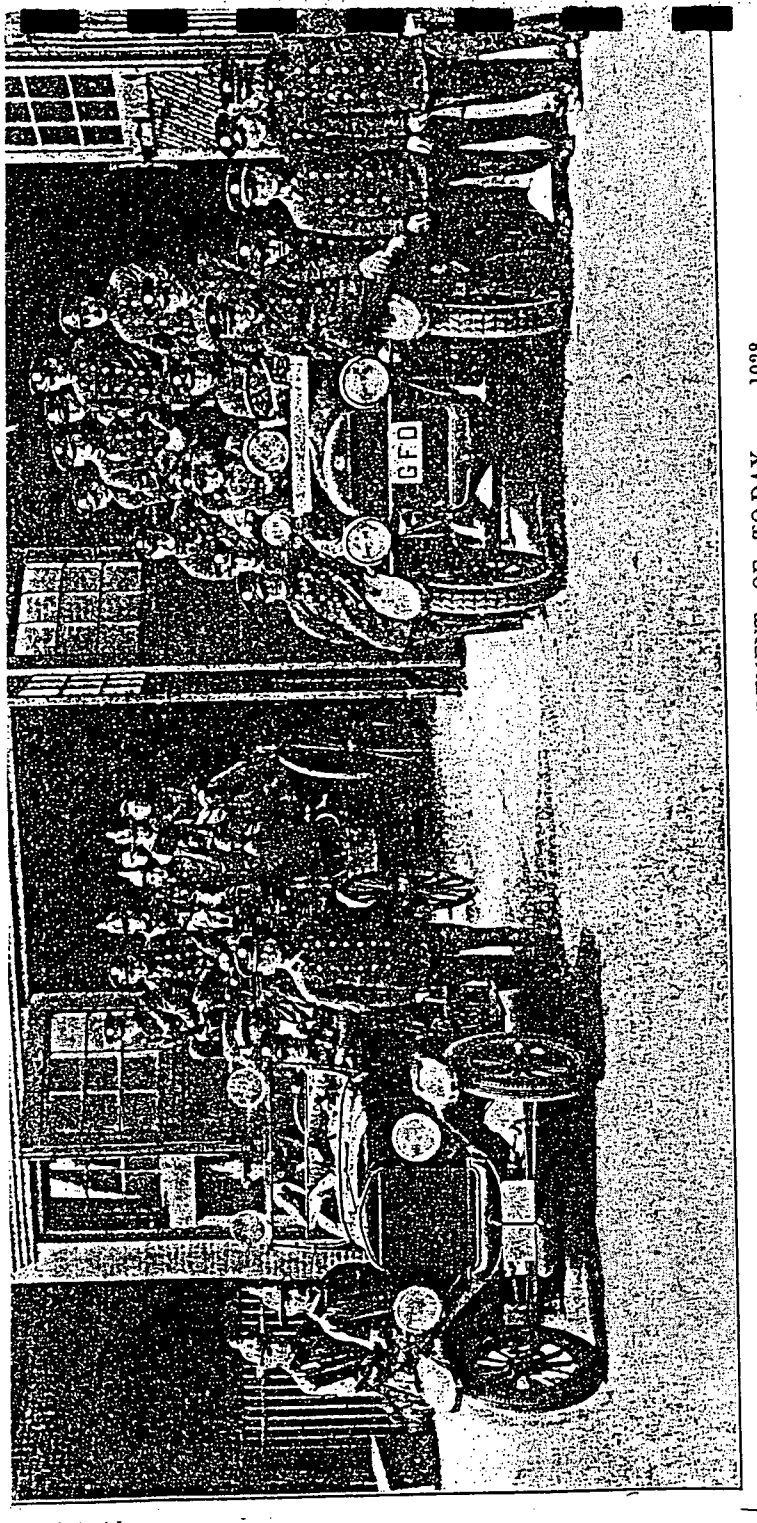
The Garwood Catholic Club was organized on May 14, 1913, with seven members. Within two years the club had grown to one hundred twenty, and by 1917 purchased the property on Second Avenue on which the Church of St. Anne now stands. It was mainly through the efforts of the club, ably assisted by the Rev. James J. McDonald, rector of St. Michael's Church, Cranford, that the structure of St. Anne's was erected at a cost of $75,000. The cornerstone for St. Anne's Roman Catholic Church was laid on July 25, 1926, and the structure was completed and occupied in May, 1927. The church will for many years be a monument to the zeal and perseverance of the Catholic Club now organized as the Holy Name Society of St. Anne's.

Factories

Garwood's growth and prosperity has been intimately connected with the development of her industries. Beginning with the Hall Signal Company in 1892, factory after factory has sprung up until there are at present fifteen different establishments. Garwood owes its position as "The Industrial Center of Union County" to the advantages derived from its railroad facilities, being situated on one of the principal trunk lines of the East. The factories are a great asset to the borough not only because they offer employment to many residents, but also because of the revenue received in the form of taxes which has made it possible to provide the splendid school facilities and municipal improvement which would otherwise have been impossible.

A list of the factories together with the products which they manufacture is given below:

Aeolian Company, Player pianos, organs.
Anchor Post Iron Works, Fences, Iron Railings.
Armor Bronze, Bookends, Art Objects, Lamps and Smoker Stands.
Beckley Perforating Company, Revolving Screens of perforated metals.



GARWOOD'S FIRE DEPARTMENT OF TO-DAY — 1928

ATTACHMENT F-3

Bowen Research Laboratories, Now experimenting on dry fruit and juices.

Dif Corporation, Household Cleaning Materials.

Esda Mfg. Company, Automatic Water Heater.

Excel Asbestos Company, Asbestos Packing.

Federal Foundry Co., Soil Pipes and Iron Castings.

Klenzig Mfg. Co., Cleaning Fluids.

Knickerbocker Ice Company, Artificial Ice.

Magnus Chemical Company, Inc., Industrial Cleaning Materials.

Newhall Company, Shield Drills, Cable Clamps, Toggle Bolts.

Pattern and Model Shop, Pattern Makers.

Pioneer Products Corp., Celluloid and Metal Novelties.

Rodic Rubber Company, Hard Rubber Articles.

Thatcher Furnace, Stoves, Boilers, Radiators.

U. S. Aluminum Company, Aluminum Castings.

Vendix Mfg. Co., Pencil Vending Machines.

Zobell Electric Company, Electric Motors.

Post Office

In 1894 the post office was started in a corner of the railroad station with Leonard G. Cohen as the first postmaster. As the mail increased in volume the post office was moved to a corner of the newstand now occupied by David Burke. In 1910 the volume of business necessitated another change to a building on North Avenue just east of Centre Street. Later the office was changed to the Silberg Building on South Avenue and Centre Street and on June 1st, 1926, a change was again made to the present commodious building especially erected by Mr. Silberg to house the post office. So large had the postal business become by 1924 that free delivery was instituted. There are two regular deliveries daily with post boxes situated at convenient points throughout the borough, from which frequent collections are made.

Bank

On January 15th, 1923, the First National Bank was opened for business. This institution has been a great asset to the borough as it was formerly necessary for residents as well as the Council and Board of Education to carry their accounts in out of town banks. The steady growth of the bank is a testimony to the foresight of those men who gave of their time and money in order that the town might have modern banking facilities. For several years, the bank has promoted thrift among the school children by having a school savings department in which school children have deposited a total of $1,933.55 during the present year.

Garwood's Industries

DIAMOND EXPANSION BOLT COMPANY

Started in 1888 by Henry B. Newhall. Moved to Garwood in 1907. Home office moved from New York to Garwood in 1926. Products are mainly expansion bolts and allied products which are used for making attachments to masonry construction. Also makes pole line specialties used by Bell System and independent telephone companies. Has branches in Boston, New York, Philadelphia, Detroit, Chicago, St. Louis, Atlanta, Dallas, Los Angeles, San Francisco, Seattle, Montreal, Toronto, Winnipeg, Vancouver and Havana. Officers include Carleton H. Bunker, President; Fred H. Adami, Executive Vice-President; Ethan N. Hescock, Vice-President; John A. Wright, Vice-President-in-Charge-of-Sales; Roscoe S. Lathe, Treasurer, and David Tulloch, Secretary. Employs 216 people.

BEST-WAY WATERPROOFERS, Inc.

Incorporated November, 1951. Temporary quarters at 92 Third Avenue, with new quarters being erected in North Avenue. Officers include Ralph DiBattista, President; Robert C. Malenchek, Vice-President; William E. Malenchek, Secretary. Employs 11 people. Specialists in residential, commercial and industrial waterproofing.

EDWARD HANDLER & SON

Manufacture dental motors, polishing and dust collecting machines, dental flasks, compresses and presses. Located at 86 North Avenue in November, 1948, after twenty-eight years in Newark. Regret they did not move here long ago.

EXCEL TOOL & DIE CO., Inc.

Designs and manufactures tools, dies, jigs, fixtures, gauges and special machinery. Located at 628 South Avenue. Founded in 1943 in Rahway and moved to Garwood in December, 1952. Employs 80 people. Officers include Stephen G. Gillich, President; Joseph Forster, Vice-President and Superintendent; Mrs. Mildred Gillich, Executive Secretary; Anthony H. Blanken, Jr., Plant Manager; Mrs. Marie Grillo, Corresponding Secretary.

DEREMER BUILDING SUPPLY CO.

Supplies all types of building materials, specializing in millwork. Located at 401 South Avenue. Incorporated in October, 1951. Successor to Albert Deremer Construction Company, operating in Garwood since 1906. A. C. Deremer, proprietor.

SONOCO PRODUCTS COMPANY

Manufactures paper tubes, cores and spools. Began operations in Garwood in 1934. Employs 130 people. Headquarters in Hartsville, S. C. Garwood plant is under the direction of G. W. Blunt White, Vice-President. Resident General Manager is Ralph T. Posey.

ACCURATE BUSHING COMPANY

Established in 1941 as a General Machine Shop. Now specializes in making precision parts.

GARWOOD METAL COMPANY, Inc.

Bought business of old Garwood Metal Company in September, 1948. Specialize in steel, stainless steel, brass and aluminum fabrication and welding. Fabricate vending machines, filing cabinets, and parts for the Army, Navy and Air Force. Located at 231 North Avenue.

STANDARD NIPPLE WORKS

Started operation in Garwood in June, 1951, after 25 years in Newark. Located at 15 North Avenue. Manufacture steel and brass pipe fittings used for building and industrial construction. Officers include N. H. Sugarman and J. J. Gillet. Employ 14 people.

HEFLER-SNYDER CO.

Started operation in Garwood in 1921 under name of Joseph F. Burke Co. Purchased in 1944 by Hefler-Snyder. Manufactures bituminous road materials of all types, and specializes in industrial paving. Officers include Allen Snyder, President; Burton E. Dickerman, Vice-President, and Arthur Stokey, Treasurer. Will move main office from Plainfield to Garwood this year. Employs 58 people.

LA BELLE CLEANERS & DYERS

Founded in January, 1928, by James Stavros, H. Stavros and T. H. Vagelos. Located at 518 North Avenue.

BECKLEY PERFORATING COMPANY

Started by Albert J. Beckley in Meriden, Conn., in the 1890's. Moved to Garwood in November, 1905. Officers include Mrs. C. D. Gilpin, President; Thomas O. Young, Jr., Vice-President; Russell J. Freeman, Secretary, and Mary Gilpin Vander Meulen, Treasurer. Employs 65 people.

GARWOOD SURGICAL INSTRUMENT MANUFACTURING CO.

Founded in November, 1940, at 354 North Avenue by William Martin and Gustave A. Huber. Manufactured precision stainless steel instruments to meet the requirements for eye, ear, nose and bone surgery for the Armed Forces during the war years, now specializes in the manufacture of manicure and pocket implements. Officers include Gustave A. Huber, President and Treasurer; Fred A. Kronseder, Vice-President and Factory Manager; Agnes Huber, Secretary; Marian E. Esposito, Assistant Secretary and Office Manager. Employs 25 people steadily, 60 during peak production. Expects to increase number of employees under current expansion program.

SPRAY DRYING SERVICE

Established in 1936 to meet specialized demand in the drying field. Offers custom drying service for experimental and development work. Located at 501 North Avenue. Officers include Charles P. Bailey, President; William E. Horr, Treasurer, and Charles Mackay, Secretary.

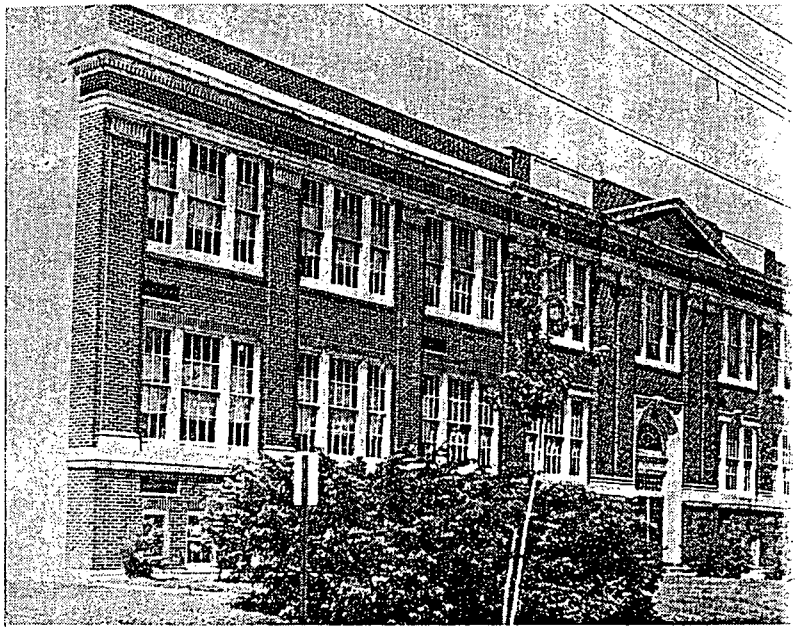
WADELL EQUIPMENT COMPANY

Founded in 1944 by George Wadell. Originally manufactured automotive maintenance equipment, subsequently turned to aeronautical maintenance tools. Purchased in 1949 by the Massari Brothers Machine Company, founders of the Accurate Bushing Company. Located at 101 South Avenue. Employs 50 people.

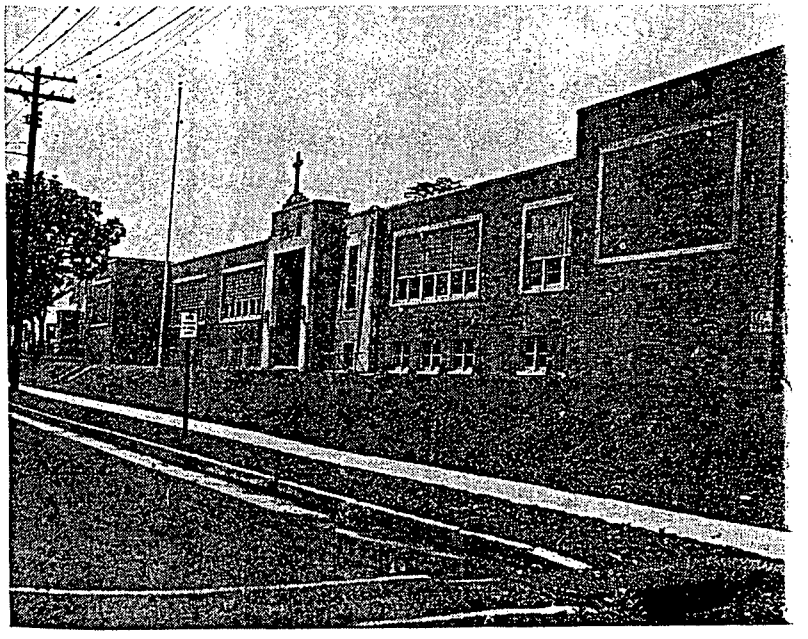
MAGNUS CHEMICAL COMPANY

Founded in 1921 in Brooklyn. Moved to Garwood in 1928. Makes many kinds of cleaners for home and industry. Affiliated companies include the Dif Corporation, the Marine and Power Plant Service Division, the Equipment Division and Industrial Processing Division. Officers include W. M. Campbell, President; D. Blanchard, Vice-President, Sales; R. W. Mitchell, Vice-President, Production; W. M. Garbe, Treasurer, and H. Y. Barrow, Secretary.

ATTACHMENT C-3



LINCOLN SCHOOL



ST. ANNE'S PAROCHIAL SCHOOL

NHN TOOL & DIE COMPANY

Started in a garage at 11 Cedar Street in November, 1941. Moved to 201 South Avenue in 1943. Manufactures tools, dies, jigs, gauges and special machinery. Also makes parts for television and for light meters. Employs 18 tool and die makers. Officers include Joseph Hoefele, President and Treasurer; Walter E. Hoefele, Vice-President; Flora Hoefele, Secretary, and William H. Durow, Jr., General Manager.

FIBRO CORPORATION

Started February 18, 1946, by Frank, Louis, Jerry, John and Albert Fontenelli — five brothers from whom name is derived. Manufacturers of all types of molds for plastic industry, die casting dies, tools, jigs, fixtures and special machinery. Plastic injection molders of all types of Thermo-Plastics. Started with 2 employees, now employs 40.

LERMER PLASTICS, Inc.

Moved to 502 South Avenue in January, 1952, from Newark, where they had been in business for 35 years. Manufacture plastic containers and injection molded articles. Employ 35 people.

PHOENIX ASBESTOS MANUFACTURING COMPANY

Established in 1890 in New York City. Began operations at 403 South Avenue in 1917 under name of Excel Asbestos Manufacturing Company. Make complete line of mechanical packings and gaskets. In addition to asbestos, they also use lead, teflon, fiber glass and rubber. Plant is operated by Carlton W. Blank, son of the founder.

MASSACHUSETTS PRODUCTS CORPORATION

Moved to 231 North Avenue in September, 1948. Make plastic novelties including cigarette cases, letter openers, tie racks, salt and pepper shakers, novelty boxes and canteens.

ROLLER CORPORATION OF AMERICA

Started at 611 South Avenue in July, 1951, under name of G-R-O Printing Roller Company. Incorporated under present name in March, 1953. Manufactures exclusive rubber printing roller for letter presses. Edward Monett is President, Leo Ragonese is Plant Manager and Charles T. Dickey is Research Engineer and Chief Analyst.

THE GENERAL CELLULOSE COMPANY, Inc.

Incorporated in 1933. First Garwood plant in Thatcher Building in August, 1934. Moved to present location at 544 South Avenue in October, 1937. Make cellulose items for industrial, candy and hospital fields. Manufacture S'WIPE'S, professional towels, roll tissue and Danner Nipkins. Subsidiaries include Tissue Converting Company, Softish Products Company and Cellulose Wadding Products Company.

GARWOOD PLASTICS, Inc.

Started operations at 141 South Avenue in March, 1946. Make industrial plastic items. Officers include Max Famely and Joseph N. Scher.

BAYONNE TOOL & MANUFACTURING COMPANY

Located at 37-43 South Avenue in April, 1950. Formed in Bayonne in 1947 by Milton R. Mielech, Benjamin A. Wisniewski and John T. Soja, who still operate business. Make tools, dies, jigs, fixtures, molds, special machinery, ignitor and fuel primers for jet engines. Employs 25 people.

NATIONAL GYPSUM COMPANY

Started operations in Garwood in 1946. One of 36 plants operated by Company. Manufactures paper board which is used in Gold Bond Gypsum Wall Board and Building Lath. Company also makes paint, lime, plaster, insulation materials, asbestos shingles and siding, and acoustical products. Employs 100 people.

SUBMIT THE ORIGINAL PLUS TWO COPIES OF THE FOLLOWING:
(NOTE: ITEM FOURTEEN (14) REQUIRES THREE COPIES)

9. A scaled site map identifying all areas where hazardous substances or wastes have been or currently are generated, manufactured, refined, transported, treated, stored, handled or disposed, above or below ground.
IS THIS MAP ENCLOSED? ☒ YES (See Appendix # I) ☐ NO

10. A detailed description of the most recent operations and processes at the industrial establishment organized in the form of a narrative report designed to guide the Department step-by-step through a plant evaluation, with particular emphasis on areas of the process stream where hazardous substances and wastes are generated, manufactured, refined, transported, treated, stored, handled or disposed on site, above or below ground. Also identify any floor drains with their points of discharge, septic systems if applicable, seepage pits and dry wells. Please note that establishments which ceased production prior to December 31, 1983, but are subject to ECRA because of on-going storage beyond that date, must provide details on past operations.

IS THIS REPORT ENCLOSED? ☒ YES (See Appendix # II) ☐ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): _____

FOR DEP USE ONLY

Name No. _____

ATTACHMENT 14-1

11. A. A description of the types, age (installation date), construction material, capacity, contents, and locations of storage vessels, surface impoundments, landfills, or other types of storage facilities, including drum storage, containing hazardous substances or wastes.

ARE THESE FACILITIES IDENTIFIED ON YOUR SITE MAP OR DESCRIBED IN A NARRATIVE REPORT?
☒ YES (See Appendix # III) ☐ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): _____

B. The integrity of all underground tanks which contain hazardous wastes or substances must be verified. This may be accomplished in one of several ways: a) Performance of a satisfactory leak test in conformance with Criterion 329 of the National Fire Protection Association, or; b) Performance of subsurface soil investigation (soil borings and analysis), or; c) Excavate and remove the tank and establish the absence of contamination, or; d) other methods approved by the NJDEP.

ARE THE RESULTS OF THE LEAK DETECTION TEST OR THE SUBSURFACE INVESTIGATION ENCLOSED?
☒ YES (See Appendix # IV) ☐ NO

IF YOU HAVE CHECK "NO", STATE THE REASON(S): _____

12. A complete inventory of hazardous substances and wastes, including description and locations of all hazardous substances or wastes generated, manufactured, refined, transported, treated, stored, handled or disposed on site, above and below ground, and a description of the location, types and quantities of hazardous substances and wastes that will remain on site. (Attach additional sheets if necessary.) Review N.J.A.C. 7:1E, Appendix A and N.J.A.C. 7:26-8 prior to completing to ensure that all defined hazardous materials are included.

MATERIAL	QUANTITY	LOCATION (See Figure I-1)	STORAGE METHOD	TO REMAIN ON SITE (Yes or No)
No. 2 Fuel Oil	5,000 gal	1	Underground Tank	Yes
No. 2 Fuel Oil	3,000 gal	2	Underground Tank	Yes

ATTACHMENT H-2

13. A. A detailed description, date and location on a scaled map of any known spill or discharge of hazardous substances or wastes that occurred during the historical operation of the site and a detailed description of any remedial actions undertaken to handle any spill or discharge of hazardous substances or wastes. (Attach additional sheets if necessary.)

IS THIS INFORMATION ENCLOSED? ☒ YES (See Appendix = V) ☐ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): _____

ARE THE SPILLS IDENTIFIED ABOVE INDICATED ON THE SCALED SITE MAP? ☐ YES ☒ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): These are discussed under Appendix V enclosed. There have been no known spills during the historical operations of the facility.

13. B. If this facility has an approved Spill Prevention Control and Countermeasure Plan (SPCC), enclose a copy with this submittal.

IS YOUR SPCC PLAN ENCLOSED? ☐ YES (See Appendix = _____)
☒ NO, this facility is not required to have an SPCC plan

14. A. A detailed sampling or other environmental evaluation measurement plan which includes proposed soil, groundwater, surface water, surface water sediment, and air sampling determined appropriate for the site. (This sampling plan must be developed in conformance with ECRA Regulations N.J.A.C. 7:1-3.14 et seq., and Quality Assurance Guidelines as developed by DEP)

ARE THREE COPIES OF THE SAMPLING PLAN ENCLOSED? ☐ YES (See Appendix = _____
☒ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): No significant spills or unauthorized discharges of hazardous substances are known to have occurred during the historical operations of the plant. Therefore, no sampling or environmental evaluation measurement plan is needed.

14. B. If the sampling plan includes groundwater sampling and/or the installation of monitoring wells, the applicant must complete a "Request for Hydrogeologic Assessment" form (blank form attached).

IS GROUNDWATER SAMPLING PROPOSED? ☐ YES ☒ NO

IS THE "REQUEST FOR HYDROGEOLOGIC ASSESSMENT" FORM ATTACHED? ☐ YES (See Appendix = _____)
☒ NO

ATTACHMENT H-3

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): No groundwater sampling is proposed.

15. A detailed description of the procedures to be used to decontaminate and/or decommission equipment and buildings involved with the generation, manufacture, refining, transportation, treatment, storage, handling, or disposal of hazardous wastes or substances including the name and location of the transporter, the ultimate disposal facility, and any other organizations involved.

IS THE DETAILED DESCRIPTION ENCLOSED? ☒ YES (See Appendix # VI) ☐ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): _____

16. Copies of all previous soil, groundwater and surface water sampling results, including effluent quality monitoring, conducted at the site of the industrial establishment during the history of ownership/operation by the owner or operator. Also include a detailed description of the location, collection, chain of custody, methodology, analyses, laboratory, quality assurance/quality control procedures, and other factors involved in preparation of the sampling results.

ARE HISTORICAL RESULTS ENCLOSED? ☒ YES (See Appendix # VII) ☐ NO

IF YOU HAVE CHECKED "NO", STATE THE REASON(S): _____

APPENDIX II

DESCRIPTION OF CURRENT OPERATION

(ECRA FORM 2 - SECTION 10)

ATTACHMENT H-5

SECTION 10. DESCRIPTION OF CURRENT OPERATIONS

The Loral Packaging Company, Inc. current operations include manufacturing and labeling of plastic containers for pharmaceuticals and other products. The operations require injection molding, printing and silk-screening processes. Finished product is packaged and stored for shipping in Building O-2.

The company utilizes polystyrene, polypropylene and polyethylene as raw materials which are brought to the plant by truck and rail. It uses polyethylene/polypropylene glycol (tradename PLUROCOL) as a release agent/lubricant/destatisizer during the injection molding process and toluene solution for periodic cleaning of molding machines. Other materials used in the operation include print lacquor, print pigments and a toluene base thinner (Reducer 223). All wastes generated from the operations are disposed of off the plant site.

The polystyrene and polypropylene comes in the form of pellets which are stored in two, thirty-two foot high (15,000 gallon) tanks located adjacent to the rail spur on the north side of the property (area 3, figure 1-1). Other raw materials come in bags or boxes by trucks and are stored in Building R. The pellets from the tanks are transported by vacuum lines to the injection molding machines (buildings S and S1). Materials stored in boxes and bags are moved by fork lift truck to the molding machines. The plastic pellets are mixed with coloring pellets and fed into the molding machines. The waste materials generated during the molding process include off-spec. containers and

waste plastic produced during startup and cleanout. Much of the waste plastic is either recycled during subsequent runs or sold to other plastic manufacturers. The remainder is discarded into a trash compactor and disposed of in an approved landfill. Approximately 55 gallons of PLUROCOL is used as a lubricant/destaticizer in the injection molding process each year.

Periodically, the molding machines are cleaned with toluene. The waste toluene cleaning solution is collected and placed in drums in area 6 along with waste hydraulic oil. Approximately four, 55 gallon drums are generated every three months (880 gallons/year) which are disposed of through M&B Used Oil Service (EPA No. NJT350011219), a commercial waste oil disposal firm located in Bayonne, New Jersey.

Cooling water for the injection molding machines is obtained from an onsite groundwater production well located in the back of Building S-1. The well screen is located in the Brunswick Formation at a depth of 300 feet. Approximately 200 gallons per minute (GPM) of water is circulated through the injection molding machines as non-contact cooling water and discharged into a storm sewer which eventually discharges into the Rahway River. This groundwater use is regulated under Permit No. 26-2549 issued by the Division of Water Resources, New Jersey Department of Environmental Protection (NJDEP). The discharge water is annually analyzed for bacteria and chloride to monitor salt intrusion into the aquifer.

Print lacquor is stored in drums located in Area 6 and used by the print department. Empty lacquor drums are utilized to store waste solvent and hydraulic oil. The waste drums are later removed by a commercial waste oil hauler.

Print pigments used for labels on the containers, are stored in one-pint cans in the print department building. These pigments are thinned (when necessary) with toluene base Reducer 223 and fed into the off-set print and silk screen machines. The machines are also cleaned with rags soaked with Reducer 223. The used rags and empty one-pint pigment cans are placed in a compactor/dumpster for trash pickup and eventual disposal in an approved landfill by Highway Disposal Company of Garwood, New Jersey.

Finish products are packed and stored in building O-2 for shipment. Pallets of boxed containers and supplies are moved around the plant and warehouse by propane powered and electric powered fork lift trucks.

APPENDIX V

KNOWN SPILLS OR DISCHARGES

(ECRA FORM 2 - SECTION 13)

ATTACHMENT H-11

SECTION 13 - DESCRIPTION OF KNOWN SPILLS OR DISCHARGES

1. Approximately two years ago, water was detected in the 3000) gallon fuel oil tank located in area 4 indicating a potential leak. Upon excavating, holes were noticed on the top of the tank. However, no oil was observed in the surrounding soil. The old tank was removed and replaced with a new 3000 gallon steel tank.

2. Incidental spillage of raw materials occurs during the transfer of pellets from rail cars to storage tanks at location 3. The pellets are inert substances (polypropylene and polystyrene) which are not degradable under normal environmental conditions. A surficial cleanup is routinely performed as part of normal cleaning operations.

3. Soils along the tracks behind the plant (area 7-8) were observed to be stained with a black, oily resinous substance of unknown origin. It is suspected that the substance may have originated from the railcars. A surficial cleanup is planned to eliminate this condition.

4. No unauthorized or accidental discharges are known to have entered the environment during the known historical operations of the plant.

3.0 AREAS OF ENVIRONMENTAL CONCERN

The initial soil investigation study by URS at the Loral-Garwood site has indicated one area to be of environmental concern to the local ground water. This is an area near an underground fuel oil tank located in the northeastern corner of the property (Figure 3.1). The following is a brief discussion of this area and of previous soil sampling and analysis performed in the proximity of the tank.

3.1 PREVIOUS SAMPLING AND ANALYSIS

The initial soil investigation study for the Garwood site was completed in February 1986 by URS. Four soil borings were taken within five feet of the sides of the tank (Figure 3.2). Split spoon samples were taken at a depth of ten feet below the surface, and analysis on the soil samples indicated that the area was contaminated with petroleum hydrocarbons ranging from 200 to 1800 ppm. These soil samples were taken below the ground water table, and thus, the results may be subject to NJDEP objections as to their validity.

3.2 PREVIOUS REMEDIAL ACTIONS

The underground tank was removed by IT and approximately 300 cubic yards of contaminated soil were excavated in three stages. At one point during the soil excavation, Building S required shoring of its foundation because of its close proximity to the excavation. Before backfilling, IT installed a french drain at the bottom of the tank excavation and a six-inch diameter, slotted, well casing. This well does not meet NJPDES construction standards. This well will not be utilized during sampling, but will be used to take water level readings.

4.0 ENVIRONMENTAL SETTING

4.1 SITE LOCATION AND TOPOGRAPHY

Loral Packaging, Inc. facility is located at 520 South Avenue, Garwood, New Jersey (see Figure 1.1). The plant is located in a industrial commercial section of Garwood and consists of eight buildings. The plant is bordered by CNN railroad tracks to the north. The majority of the site is paved and the ground surface slopes gently to the south-southeast. Surface runoff is intercepted by the local sewer system.

4.2 SITE GEOLOGY

The site is covered with a fill of variable composition and thickness. The fill ranges in composition from a clean structural fill of bricks and gravel to a moderately plastic, silty clay which varies from one to eight feet in thickness. The underlying natural sediments consist of a sandy till with variable amounts of silt and clay. A gravel and sand pocket, which is thought to be a buried stream channel or deposit, was noted at a depth of seven to eight feet along the north and south faces of the tank excavation. Below this gravel deposit, the sandy till was again encountered.

Bedrock is estimated to be 12 to 16 feet below the surface based upon pile driving refusal depths. The bedrock at the site is the New Brunswick Shale. The shale generally weathers to a moderately plastic, silty clay with an associated low permeability. The weathered rock layer often acts as a clay cap on the unweathered bedrock, thus, retarding ground water flow between the rock and overburden.

4.3 SITE HYDROGEOLOGY

Current hydrogeologic information is limited and is based on water level readings taken at monitor well location number one (see Figure 2.1) and U.S.G.S. topographic maps. The information obtained during the water sampling

ATTACHMENT I-6

and analysis phase will help define the ground water flow patterns and graidents. The best estimated ground water flow direction is to the south-southeast towards a stream located two blocks south of the site. This flow direction also corresponds to the general slope of the site which is to the southeast. Water level readings taken at MW-1 indicate that the ground water table is encountered at a depth of 8.2 feet below the surface.

EXECUTIVE SUMMARY

ECRA site assessment activities performed at the Loral Packaging facility in Garwood, New Jersey, have included the collection of soil samples, installation of monitoring wells, collection of groundwater samples, dye testing of two pits, and the evaluation of sumps at the facility. Soil sampling identified two areas of the site with surficial petroleum hydrocarbon contamination. Further delineation sampling is proposed for the Drainage Ditch/Compressor Blowdown and Sump Discharge Area. After delineation, cleanup for this area and the Former Drum Storage Area which also had elevated levels of petroleum hydrocarbons in the shallow soils will be addressed.

Petroleum hydrocarbons were detected in the groundwater at levels slightly above ECRA guidelines. Volatile organic compounds which have not been used at the site were also identified in the groundwater. Since groundwater contours could not be determined due to a localized mounding effect, further investigation is proposed to determine the source of the petroleum hydrocarbons and volatile organics. The efforts will include a review of NJDEP well records and ECRA cases in the vicinity. A pump test of the on-site production well is also proposed to determine if the well is effecting groundwater flow.

Initial dye testing of the pits did not confirm the discharge point, however, an additional potential discharge location at the site was subsequently identified. The tests will be repeated while monitoring the additional potential discharge point.

Discharges to the drainage ditch from the four sumps at the site will be discontinued.

ATTACHMENT D-6

TECHNICAL OVERVIEW

Site assessment activities have been undertaken in response to the Environmental Cleanup Responsibility Act (ECRA) at the Loral Packaging facility in Garwood, New Jersey. The activities were performed in accordance with the Sampling Plan submitted in March 1987, the Report of Inspection dated December 21, 1987, the Sampling Plan Addendum submitted in April 1988, and the New Jersey Department of Environmental Protection (NJDEP) approval letter dated May 25, 1988. Activities included the following:

- Collection of soil samples from the Drainage Ditch/Compressor Blowdown and Sump Discharge Area
- Collection of soil samples from the Former Drum Storage Area
- Determination of the discharge location of the Collection Pit on the North Side of the Facility
- Determination of the discharge location of the Covered Pit Inside the Facility
- Tightness testing of the abandoned underground storage tank
- Evaluation of measures to ensure that no hazardous materials reach the drainage ditch on the east side of the facility via the compressor blowdown and sump pumps
- Installation of monitoring wells to assess the quality of the groundwater underlying the site.

FINDINGS

GENERAL

Seven areas requiring investigation were identified at the Loral Packaging facility in Garwood, New Jersey. These areas included the Drainage Ditch/Compressor Blowdown and Sump Discharge Area, Former Drum Storage Area, Collection Pit on the North Side of the Facility, Covered Pit Inside the facility, Abandoned Underground Storage Tank, Sump Pumps, and the Quality of the Groundwater Underlying the Site.

The site assessment activities to address these areas were performed in accordance with the procedures described in the Sampling Plan, Sampling Plan Addendum and NJDEP approval letter with the following exceptions:

- All soil samples at the 18 to 24-inch depth in the Former Drum Storage Area were analyzed for base/neutral compounds rather than limiting the analysis to twenty five percent of the samples. The additional sampling was performed to determine if the petroleum hydrocarbons identified at the 0 to 6-inch depth were confined to the surface soils.

- The location of monitoring well MW-4 was modified in the field due to the presence of an underground storm sewer system and the proximity to a heavily trafficked area.

- The depth of the screened interval on monitoring wells MW-3 and MW-4 were modified since refusal was encountered at a depth of 12 feet.

- Analysis of the soil samples collected during the monitoring well installation were limited to base/neutral compounds and petroleum hydrocarbons which are the compounds of concern in the area of the removed underground fuel oil tank. Volatile

organic compounds and pH were not measured. Soil samples were not analyzed for volatile organic compounds since no reported spills of volatile organic materials had occurred in this area and soil samples collected at the site revealed no detectable concentrations of volatile organic compounds.

Detailed descriptions of the activities performed for each area of concern including sample collection and analytical results are presented below.

DRAINAGE DITCH/COMPRESSOR BLOWDOWN AND SUMP DISCHARGE AREA

SAMPLE COLLECTION

On July 14, 1988, soil samples were collected at five locations in the Drainage Ditch/Compressor Blowdown and Sump Discharge Area located on the east side of the facility. Samples S-1 through S-5 were collected at a depth of 0 to 6 inches and submitted for petroleum hydrocarbon analysis. As requested in the Sampling Plan Approval letter, 25 per cent of the samples were analyzed for base/neutral compounds. Based on field observations, samples S-1 and S-5 were selected for analysis for base/neutral compounds.

ANALYTICAL RESULTS

Petroleum hydrocarbon concentrations were detected at levels ranging from 1,100 to 50,000 parts per million (ppm). The base/neutrals analyses revealed concentrations of targeted compounds in S-1 of 436.1 ppm and S-5 of 4.7 ppm. The non-targeted peaks in these samples were estimated at 102.1 ppm and 69.4 ppm, respectively. With the exception of 5 ppm of bis (2-ethylhexyl) phthalate, which is below the ECRA guideline of 10 ppm for base/neutral compounds in soil, the targeted base/neutral compounds identified in S-1 are typical components of asphalt. Based on the sample location and shallow depth, the base/neutral

compounds identified in S-1 are probably attributable to fragments of asphalt paving being collected with the soil sample. The targeted base/neutral compounds identified in S-5, 3.5 ppm of bis (2-ethylhexyl) phthalate and 1.2 ppm of pyrene, were below ECRA guidelines. The soil sampling results are summarized in Table 1 and illustrated on Figure 1. Analytical data including Tier II deliverables is provided in Appendix A.

FORMER DRUM STORAGE AREA

SAMPLE COLLECTION

Soil samples were collected from four locations, S-6 through S-9, in the vicinity of the Former Drum Storage Area. On July 14, 1988, soil samples were collected from locations S-6 through S-9 at depths of 0 to 6 inches and 18 to 24 inches and submitted for petroleum hydrocarbon and base/neutrals analyses, respectively. Originally, only one sample from 18 to 24 inches was to be analyzed for base/neutral compounds. However, based on field observations, samples from each of the locations were collected at the 18 to 24-inch depth for base/neutrals analysis to determine if the petroleum hydrocarbons suspected at the 0 to 6-inch depth had impacted the deeper soils.

In addition to the petroleum hydrocarbon and base/neutral analyses, samples were collected from each location at a depth of 18 to 24 inches for volatile organics analysis. A sample from S-7 was collected on July 14, 1988, and samples from S-6, 8 and 9 were collected on August 4, 1988. Field screening of these samples with an Organic Vapor Analyzer (OVA) revealed no detectable concentrations of organics.

ANALYTICAL RESULTS

Petroleum hydrocarbons were identified in the 0 to 6-inch depth samples at concentrations ranging from 1,700 to 25,000 ppm.

TABLE 1

SUMMARY OF ANALYTICAL RESULTS

Petroleum Hydrocarbons (ppm)	case-by-case	21,000	3,800	1,100	9,100	50,000

-- = not analyzed
* = estimated concentration

213:977

ATTACHMENT 5-11

The concentrations of targeted base/neutral compounds at 18 to 24 inches ranged from undetected to 0.28 ppm. The estimated levels of non-targeted base/neutral peaks varied from 4.4 to 9.1 ppm. The total concentrations of base/neutral compounds at all sampling locations were below the ECRA guideline level of 10 ppm for soils.

Targeted volatile organic compounds at all sampling locations were undetected with the exception of very low levels, 0.006 to 0.015 ppm, of methylene chloride and 0.004 ppm of toluene, which were also identified in the laboratory blank. Estimated concentrations of non-targeted volatile organic peaks ranged from 0.021 to 0.044 ppm. The total concentration of volatile organic compounds at each sampling location was well below the ECRA guideline of 1 ppm for soils. These laboratory findings confirm the OVA readings during sample collection.

The soil sampling results are summarized in Table 2 and illustrated on Figure 1. Analytical data including Tier II deliverables is provided in Appendix A.

COLLECTION PIT ON THE NORTH SIDE OF THE FACILITY

On August 1, 1988, the storm water collection pit on the north side of the facility was dye tested to determine its discharge location. Plant personnel identified the sewer junction chamber which was believed to service the facility and the storm water collection pit. Monitoring of the junction chamber during the injection of dye in the collection pit was inconclusive and did not confirm that the collection pit discharged to the storm sewer. A subsequent survey and investigation of the sewer system in the vicinity of the facility has revealed another junction chamber which appears to receive storm water from the site. Therefore, another dye test of the collection pit will be performed with both junction chambers monitored.

COVERED PIT INSIDE THE FACILITY

The drainage pipe in the covered pit located inside the facility was dye tested on August 1, 1988, to confirm that it discharged to the municipal storm sewer system. Monitoring of the junction chamber, which plant personnel had identified as servicing the facility, was inconclusive. A subsequent analysis of the sewer system in the vicinity of the site has identified another junction chamber which appears to receive storm water from the facility. Based on this finding, another dye test of the drainage pipe will be performed while monitoring both junction chambers.

ABANDONED UNDERGROUND STORAGE TANK

On July 14, 1988, the abandoned underground storage tank located in Building S-1 adjacent to the boiler room was inspected. The capacity of the tank is 3,000 gallons. It is believed that the tank was previously used to store fuel oil for the facility's boiler. Approximately 10 inches of residual liquid was identified in the tank. The liquid was sampled and submitted for laboratory analysis for volatile organic compounds using a non-compliance gas chromatograph screen. The laboratory analysis revealed approximately 13.6% toluene and 0.01% total xylenes.

On August 29, 1988, the integrity of the tank was determined using the Petro-Tite tank test method which conforms to Criterion 329 of the National Fire Protection Association (NFPA). Prior to testing the tanks, the residual liquid contents were pumped into 55-gallon drums and the tank was power washed and cleaned. The Petro-Tite test was performed using water. The results of the precision test are summarized below:

TANK ID	PRODUCT	CAPACITY	NET VOLUME CHANGE	CRITERIA
Abandoned Tank in Bldg. S-1	Water	3,000 gal.	1.318 gph	$\leq \pm$ 0.05 gph

The results indicate that the tank system did not meet the NFPA's accepted criteria for critical tank tightness (NFPA Bulletin #329, Page 30, "Final Test") as having a net system change not exceeding 0.05 gallons in one hour. Complete tank testing results are provided in Appendix B.

EVALUATION OF SUMPS

To evaluate the potential for contaminants to be discharged by the sump pumps to the drainage ditch on the east side of the facility, four sumps at the Loral Packaging facility were examined. The sumps are located in the northwest corner of Building S-1, the northeast corner of Building S, the boiler room in Building S-1, and the boiler room in Building R-2. The approximate locations are illustrated in Figure 1.

The four sumps were originally installed at the facility to collect water that might enter the building during periods of rainfall. Water entering the building is no longer a concern; therefore, the sump in Building S-1 is rarely, if ever, used.

The sump in Building S is used on a continuous basis to collect condensed water vapor from the air receiver which is installed on the compressed air system. The condensed water vapor is presently pumped through an activated carbon filter and discharged on the east side of the building.

The sumps in the boiler rooms are only used on an intermittent basis to collect city water when the make-up feed water control valves on the boilers are tested. These valves are normally

tested on a weekly basis and a few gallons of water are allowed to bleed from the city water supply line into the sumps. The discharges from the sumps are currently piped to the east side of the facility.

GROUNDWATER MONITORING

WELL INSTALLATIONS

A 3,000-gallon steel underground storage tank used to store fuel oil was formerly located on the north side of the facility. In 1986, the tank was removed and replaced by a 3,000-gallon fiber glass tank which is currently on-site. During the tank replacement, contaminated soil was excavated from around the tank and a french drain was installed at the bottom of the excavation.

To determine groundwater quality in the vicinity of the removed tank, four monitoring wells were installed in July 1988, at the locations shown on Figure 2. Monitoring wells MW-1 through MW-3 were installed on three sides of the former tank location. Monitoring well MW-4 was located to the southwest of the tank location on the opposite side of the building. This location varied from the location selected by the NJDEP for monitoring well, MW-4, in their letter dated May 25, 1988. The location was modified in the field due to the presence of an underground storm sewer system and proximity to a heavily trafficked loading dock.

A detailed description of well installation procedures are provided in Appendix C. Deviations from the proposed monitoring well design (i.e., modification of the depth of the screened interval) were necessary on wells MW-3 and MW-4 since cobbles and boulders were discovered at depths of 9 to 10 feet and refusal was encountered at a depth of 12 feet. Initial attempts to drill MW-1 and MW-3 were abandoned when obstructions were encountered.

ATTACHMENT D-6

Scrap steel and a boulder were encountered at MW-1 and MW-3, respectively. Drilling was terminated at each location and reinitiated at an immediately adjacent location. The abandoned borings were grouted. Boring logs and monitoring well as-builts are shown in Appendix D.

SAMPLE COLLECTION

To characterize site stratigraphy, soil samples were collected continuously during the installation of monitoring well MW-3. At all well locations, soil samples were collected from 0 to 6 inches above groundwater and submitted to an NJDEP certified laboratory to be analyzed for base/neutral compounds and petroleum hydrocarbons. Since no volatile organic compounds were detected in any of the soil samples collected at the site and no releases or spills of volatile organics are reported to have occurred at the site, samples were not analyzed for volatile organics. Details of the soil sampling protocol are given in Appendix C.

On August 1, 1988, groundwater samples were collected from MW-1 through MW-4 and the on-site production well for analysis for volatile organic compounds, base/neutral compounds, petroleum hydrocarbons, total dissolved solids, and pH. The Quality Assurance/Quality Control Procedures followed for the sampling procedures are provided in Appendix C.

GROUNDWATER FLOW DIRECTION

Static water levels were measured at each well location on August 1 and August 22, 1988. The groundwater elevation data is summarized in Table 3 and illustrated on Figures 3 and 4.

ATTACHMENT D-17

TABLE 3

WATER TABLE ELEVATION DATA

WELL NO.	ELEVATION REFERENCE (FT)(1)	WATER TABLE ELEVATION (FT)	
		8/1/88	8/22/88
MW-1	93.27	84.42	86.79
MW-2	92.70	84.45	83.64
MW-3	92.80	90.55	90.30
MW-4	89.98	82.23	81.39

(1) Reference point is north side of top of PVC well casing; elevations are reported relative to mean sea level.

ATTACHMENT 5-18

Anomalies in the groundwater elevations preclude the construction of groundwater contours in the vicinity of the former fuel oil tank location. On both dates there appears to be mounding of the groundwater in the vicinity of MW-1 and MW-3. Some possible reasons for this condition are the french drain which was installed during the tank excavation, the presence of backfill is different permeability characteristics, the building foundation, and/or the on-site production well. The french drain, backfill materials, and the production well are located between MW-1, MW-2, and MW-3. The building foundation separates MW-4 from the other monitoring wells.

ANALYTICAL RESULTS

Soil Samples

The results of laboratory analysis of soil samples collected from 6 inches above groundwater during installation of wells MW-1 through MW-4 are summarized in Table 4 and illustrated on Figure 1. Concentrations of total base/neutral compounds in all four monitoring well locations were below the ECRA guideline level of 10 ppm. Targeted base/neutral compounds were undetected in all samples and total non-targeted compounds were undetected in wells MW-1 and MW-3. Estimated concentrations of non-targeted peaks in MW-2 and MW-4 were 0.4 and 0.3 ppm, respectively. Petroleum hydrocarbons were undetected in all four samples. Complete analytical results including Tier II deliverables are provided in Appendix A.

Groundwater Samples

Analytical results of groundwater sampling are summarized in Table 5 and illustrated on Figure 2. Concentrations of total volatile organic compounds ranged from undetected in MW-1 to 116 ppb in MW-2. Trans 1,2 dichloroethylene was detected in wells

213:977

ATTACHMENT D-21

MW-2 and MW-3 at levels of 84 ppb and 21 ppb, respectively. Trichloroethylene (TCE) at 32 ppb in MW-2 and tetrachloroethylene (PCE) at 12 ppb in MW-3 and 32 ppb in the on-site production well were also detected. Vinyl chloride estimated at 5 ppb, which was below the detection limit, was detected in the duplicate of MW-2. The only volatile organic compound detected in MW-4 was tentatively identified as acetone at an estimated 7 ppb. This is believed to be a result of the laboratory decontamination of the bailers.

Petroleum hydrocarbon concentrations ranged from undetected in MW-1 and the on-site production well to 1.7 ppm in MW-2. Levels of 0.81 ppm and 1.3 ppm were detected in monitoring wells MW-3 and MW-4, respectively.

Base/neutral compounds were undetected in all wells except MW-1. Targeted compounds were detected in MW-1 at levels below ECRA guidelines. Napthalene was detected at 23 ppb. All other compounds were undetected or below the minimum detection level. An estimated value of 232 ppb was detected in the non-targeted peaks. Complete analytical results including Tier II deliverables are provided in Appendix C.

ATTACHMENT J-22

CONCLUSIONS AND RECOMMENDATIONS

DRAINAGE DITCH/COMPRESSOR BLOWDOWN AND SUMP DISCHARGE AREA

The sampling results for this area indicate petroleum hydrocarbon contamination in the surface soils at depths of 0 to 6 inches. Base/neutral compounds detected in this area are not of environmental concern since the only base neutrals detected above ECRA guidelines are believed to result from fragments of asphalt paving collected in the soil.

The horizontal extent of the petroleum hydrocarbon contamination is confined to the narrow, un-paved strip of property on the east side of the facility. The vertical extent of the contamination cannot be determined from the surficial sampling that was performed in this area. To identify the vertical extent of contamination, soil samples will be collected at greater depths and analyzed for petroleum hydrocarbons. The samples will be collected at locations S-1 through S-5 as in the previous sampling activities. The depths of the soil samples will be determined in the field by using an Organic Vapor Analyzer (OVA) to screen the soils. At the depths when no petroleum hydrocarbons are detected by the OVA, a confirmation sample will be collected and submitted for laboratory analyses.

MEDIA TO BE SAMPLED

Soil samples will be collected.

SAMPLING FREQUENCY AND LOCATIONS

Five soil samples will be collected at locations S-1 through S-5 as in the previous sampling activities. These locations are illustrated on Figure 1.

ATTACHMENT 5-23

SAMPLING DEPTHS

Sampling depths for each location will be determined in the field by screening the soils with an OVA. At the depths when no petroleum hydrocarbons are detected by the OVA, soil samples will be collected and submitted for laboratory analysis.

ANALYTICAL PARAMETERS

The delineation soil samples will be analyzed for petroleum hydrocarbons. Twenty five percent of the samples will be analyzed for base/neutral compounds.

SOIL SUMMARY

A summary of the proposed sampling activities is provided in Table 6.

SOIL REMEDIATION

The analytical results of the soil investigation will be used to determine the extent of the soil contamination in this area. If contamination is limited to the first two feet, soil excavation and removal will be performed. If contamination is more extensive, a cleanup plan will be developed.

FORMER DRUM STORAGE AREA

The results of the soil sampling in the Former Drum Storage Area identified petroleum hydrocarbon contamination in the surface soils at depths from 0 to 6 inches. It is suspected that the petroleum hydrocarbons resulted from the stock piling of excavated soils during the previous removal of the underground fuel oil storage tank. Sampling at depths of 18 to 24 inches for base/neutrals and volatile organic compounds confirm that the contamination is limited to the surface soils.

ATTACHMENT 5-24

TABLE 6

SAMPLING SUMMARY

LOCATION	MATRIX	SAMPLE DEPTH	ANALYTICAL PARAMETERS
DRAINAGE DITCH/COMPRESSOR BLOWDOWN AND SUMP DISCHARGE AREA

S-2	Soil	Depth determined in field	Petroleum Hydrocarbons
S-3	Soil	Depth determined in field	Petroleum Hydrocarbons
S-4	Soil	Depth determined in field	Petroleum Hydrocarbons
S-5	Soil	Depth determined in field	Petroleum Hydrocarbons Base/Neutral Compuonds

ATTACHMENT J-25

No further sampling is proposed for the Former Drum Storage Area. Remediation of the soils in this area will be addressed after completion of the proposed delineation soil sampling in the Drainage Ditch/Compressor Blowdown and Sump Discharge Area.

COLLECTION PIT ON THE NORTH SIDE OF THE FACILITY

Since further review of the sewer system along South Avenue has revealed the existence of an additional junction chamber that appears to receive wastewater flows from the facility, the collection pit will be re-tested with dye and both junction chambers on South Avenue will be monitored. The dye testing will be performed in conjunction with the delineation soil sampling that is proposed for the Drainage Ditch/Compressor Blowdown and Sump Discharge Area.

COVERED PIT INSIDE THE FACILITY

In conjunction with the re-test of the collection pit, the drainage pipe in the covered pit located inside the facility will also be re-tested with dye to determine if it discharges to the additional junction chamber identified during the recent review of the sewer system on South Avenue.

ABANDONED UNDERGROUND STORAGE TANK

The results of the precision test indicate that the underground storage tank is not tight. The tank is located under a concrete slab floor in Building S-1 and is adjacent to active processing equipment. Given these constraints, removing the tank is impractical. Rather than removal, the tank will be abandoned in place by removing all liquids and filling the tank with a solid, inert material such as a cement-bentonite grout.

ATTACHMENT D-26

The need for further assessment activities in this area will be evaluated after completion of the activities proposed in the Groundwater Monitoring Section of this report.

EVALUATION OF SUMPS

Based on a review of the sump operations at the facility, only the sump which receives the condensed water vapor from the compressed air system is required for plant operations. The sump in Building S-1 is rarely used and not required for plant operations. The sumps in the boiler room are only used on an intermittent basis to collect small quantities of water during the testing of the make-up water control valves on the boilers. Discharge of water from the sumps to the drainage ditch on the north side of the facility will be discontinued.

GROUNDWATER MONITORING

Groundwater monitoring in the area of the underground fuel oil storage tank indicates concentrations of TCE, PCE, and trans 1,2-dichloroethylene above ECRA guidelines. Petroleum hydrocarbons were also detected at levels slightly above ECRA guidelines. The source of the volatile organic contaminants in the groundwater is believed to be an off-site source because these compounds were not detected in the soil samples collected at the site. In addition, these materials are not used in the facility's operations and according to plant personnel, have not been used in the past.

Groundwater flow patterns at the site cannot be determined from the available static water level data. The proximity of the building to the monitoring wells and the on-site production well may be influencing the water levels observed. The production well may be creating a cone of depression in the underground fuel oil tank area. It is conceivable that a cone of depression created by the production well could cause off-site contamination

to migrate toward the production well. This argument is strengthened by the lack of contamination in MW-1 and the presence of contamination in the two monitoring wells (MW-2 and MW-3) closest to the property boundary. Additional information is required before a sound conclusion regarding the source of contaminants in MW-2 and MW-3 can be reached.

A well record search is proposed to identify well installation details of the production well to determine if it is hydraulically connected to the same water-bearing zone as the monitoring wells. A short pumping test will be conducted using the production well and monitoring wells MW-1, MW-2, and MW-3 to determine if the production well is influencing the monitoring wells. A groundwater contour map will then be constructed using water level measurements from the production well and the monitoring wells.

In addition to the well record search, a review of the on-going ECRA cases in the Garwood area will be performed. The review will concentrate on groundwater quality and floor patterns in the area since it is believed that the volatile organic contaminants identified in the groundwater at the Loral facility are emanating from an off-site source.

Cleanup Responsibility Assessment
401 East State Street
5th Floor
Trenton, New Jersey 08625

Re: Loral Packaging, Inc.
520 South Avenue
Garwood, New Jersey
ECRA Case No. 86117

Dear Mr. Buriani:

As we discussed in our telephone conversation on May 7, 1990, the installation of the monitoring well within Building R-3 at the above-referenced facility is scheduled for Saturday, May 19, 1990. Due to the location of the proposed monitoring well and the manufacturing processes conducted in that area, the well must be installed on a weekend or during a facility shutdown. March 19, 1990, was the first available date for the well installation activities. The proposed monitoring well, MW-5, will have to be a 2-inch diameter monitoring well because of the physical constraints within the building which require the use of a skid-mounted drill rig. The well will be installed adjacent to the covered pit and the 3,000-gallon underground fuel oil storage tank located inside Building R-3.

Based on the completion of the well installation on Saturday, we have scheduled the sampling of the well for June 4, 1990. Allowing approximately six weeks laboratory turnaround time and four weeks to prepare a report of results and review the report with legal counsel and the client, we anticipate submitting the results to the NJDEP by August 13, 1990. Therefore, we are requesting a 60-day extension for installing and sampling the well and submitting the results to the NJDEP.

With regard to the soil removal activities, the physical constraints of the facility prohibit the stockpiling of excavated soils at the rear of the site without significantly affecting plant operations. Therefore, we are planning on excavating the

f:3491/LOR005

ATTACHMENT K-1

soils and simultaneously transporting the soils to the disposal facility. Since landfill approval must be obtained prior to transporting the soils off-site, waste classification samples have been collected and submitted for laboratory analyses. Waste profile sheets will be prepared and submitted to the disposal facility when the analytical data is available. After receiving landfill approval, the soils will be removed and post excavation samples collected. We are presently preparing a schedule of these tasks and will forward it to you when available.

We will continue to keep you informed of the on-going investigation and cleanup activities. Should you have any questions, please do not hesitate to call.

Very truly yours,

FIRST ENVIRONMENT, INC.

MEMO
TO: FILE
FROM: ANDREW CYR HSMS NJDEP/DHWM/BPA
SUJECT: MAGNUS CHEMICAL P.S.A. 2/09/90

Donna Restivo and I of the NJDEP/DHWM/BPA arrive on site at 0914 hours. The weather is sunny and warm, temp is approx. 50 degrees F. We meet with Mr. Piscitelli of ACP Trust, owners of the property, and Mr. Greenberg of Environmental Waste Management Associates.

The site is a series of buildings leased to 15 different tenants. The site is entirely paved. Mr. Greenberg proceeded to show us the location of the five remaining USTs. He stated that samples from the tanks were collected last week and that the tanks will be removed in about a month. The area where Magnus had an above ground tank farm is now a building occupied by ICF, an enviromental contractorand is used for storage of equipment. The area behind this building was paved approx. five years ago. Readings from holes looked into packed gravel along the RR tracks were 500ppm as methane on an Organic Vapor Analizer. No drums were observed on site. The site is not fenced allowing access from the RR tracks.

I asked Mr. Greenberg about the integrity of the tanks on site. He stated that nothing was known on the condition of the tanks. The tanks are all about 10,000 gallons. Mr. Greenberg again stated that the tanks will be removed, and he invited us to be present during the excavation. We directed him to contact the NJDEP/DWR/BUST for regitration and excavation requirements.

I again asked about the tenants on site. Mr. Piscitelli stated that none of the tenants on site generate hazardous waste. The current tenants on site are as follows:

ICF- Environmental Contractor -Equipment Storage

Hooks Beverage

Brooks -Fire Control Equipment

Spruce Industries - Sanitary Products

Spotfield Productions- Stage Props

New Mints- Sportswear

Apple Knoll Printers -Warehouse

Textiles By Peterson

Lemer Packaging

Exel Air- Air conditioning and heating contractor

Team Plastics

Gum and Pockets

Cheyenne Ceiling- Interior Contractor

K-Wood working

Exxon- Record Storage

Donna Restivo and I depart site 0950 hours.

If No, state the reason _____

(Attach additional pages, if necessary)

5. Decription of Operations:

Is this report enclosed? X Yes (See Attachment # 1) ____ No

If No, state the reason _____

6. Description of Building Heating System:

A. How is the Industrial Establishment currently heated? (Oil, Gas, Electric) Oil

How long has the Industrial Establishment been heated by the above fuel/energy source: At least 13 years

B. Was the Industrial Establishment heated by fuel oil at any time: x Yes ____ No

Is information on the decommissioning of underground fuel oil tanks included with item No. 14 of this form?

____ Yes x No If no, explain below: No underground fuel tanks have been decommissioned at the site by the Landlord.

C. Are the results of the Integrity Evaluation for Existing Underground Fuel Oil Tanks enclosed?

____ Yes (See Attachment #_____) x No If no, state the reason No integrity evaluation has been performed by the Landlord to my knowledge.

7. Summary of Industrial Establishment Wastewater Discharges of Sanitary and/or Industrial Waste:

A.

Discharge Period From	To	Discharge Type	Treatment By
1981	Present	Sanitary	Sewer hook-up

B. If the Industrial Establishment discharges sanitary and/or industrial wastes to a publicly-owned treatment plant, provide the name/address of that facility.

Name Rahway Valley Sewerage Autho. Telephone # (201) 388-0868

Street Address 1050 E. Hazelwood Avenue

Municipality Rahway State NJ Zip Code 07065

	Date(s) of Discharge	Nature of Discharge
1.	1981-Present	Sanitary
2.		
3.		

8. Hazardous Substance and Waste Containment Description: *(Attach additional sheets if necessary)*

Type of Storage Unit	Date Installed	Area or Volumetric Capacity (include units)	Material Stored	Construction Type	Location Reference	Decommissioning or Sampling Reference
Underground tank	before 1975	500 gallons	Fuel Oil	Steel	See #9 below	

9. Hazardous Substance/Waste Inventory:

Material Name	Quantity (Indicate units)	Location Reference	Storage Method Container Type/Size	Typical Annual Usage	To Remain on Site (Yes or No)
Lubricating Oil	40 gal.	K-2 (See Attachment #2)	5 gallon plastic pails	5 gal.	Yes
EDM Oil	80-100 gal.	K-2	55 gallon steel drums *	55 gal.	Yes
Soluble Oil	50-60 gal.	K-2	5 gallon plastic pails	10 gal.	Yes
Fuel Oil	500 gal.	Parking Lot adjacent to K-2	Steel tank	1,200 gal.	Yes
			* Ordinarily contained inside Electrical Discharge Machining (EDM) equipment.		

ATTACHMENT W-5

10. Discharge History of Hazardous Substances and Wastes:

A. Have there been any discharges of hazardous substances and wastes?
____Yes (Complete Item B below) _x_No (Go to Item 10C)

B. Summary of Discharges and Resolutions

Description of Discharge Event	Response and Resolutions

C. Is this Industrial Establishment subject to Spill Prevention Control and Countermeasure (SPCC) per 40 CFR Part 112 or Discharge Prevention, Containment and Countermeasure (DPCC) Plan per NJAC 7:1E-4.1 requirements?

____Yes _x_No A copy of the Plan(s) may be required at the discretion of the Department.

11. Sampling Plan Proposal

A. Is sampling proposed at the facility? ____Yes (See Attachment #_____) No_x_

If sampling is not proposed, please explain below. *(Attach additional sheets if necessary)*

There have been no spills at the site to my knowledge..

B. Is groundwater sampling proposed? ____Yes _x_No

Note: If groundwater sampling is proposed under the plan, you must complete ECRA Form 002A "Request for Hydrogeologic Assessment" and submit it with the application.

ATTACHMENT N-6

12. Decontamination/Decommissioning Plan

A. Is the facility Decontamination/Decommissioning Plan enclosed?

_____Yes (See Attachment #_____) __X__No

B. If no, specify why decontamination/decommissioning is not considered necessary.

The business is continuing in operation.

13. Historical Data on environmental quality at the Industrial Establishment

A. Were sampling results obtained on Environmental Quality for the Industrial Establishment?

_____Yes (See Attachment #_____) __X__No

B. If sampling results were obtained but are not part of this application, please explain below:

14. List any other information you are submitting or which has been formally requested by the Department:

Description	Attachment #

FEE CHECKLIST

Include below a breakdown of the total fee submitted with this application. (See N.J.A.C. 7:26B-1.10 for the appropriate fees.)

Item	Amount ($)
1. Initial Notice Review	
i. Without Sampling Plan	250.00
ii. With Sampling Plan that includes only underground storage tank analysis without groundwater monitoring	
iii. With Sampling Plan other than ii. above or iv. below	
iv. With Sampling Plan that includes any groundwater monitoring	
2. Sampling Data Review	
3. Negative Declaration Review	
4. Cleanup Plan Review	
5. Oversight of Cleanup Plan Implementation	
TOTAL FEE ENCLOSED	$ 250.00

ARE FEES ENCLOSED? __X__ **YES**

ATTACHMENT #1

DESCRIPTION OF OPERATIONS REPORT

No information is available prior to 1981.

Since 1981, the industrial establishment has been a tool and die operation. The processes involved in this operation are:

Cutting of forming tools out of steel and aluminum for the die casting and plastic injection molding industry. In the operation of using mills (cutting tools) soluble oil, oil mixed with water are used to extend the life of the tools.

Surface grinding on steel is also done here. A dust collection system is used here to collect grinding chips. We also use what is called E.D.M. (Electrical Discharge Machining). Here we use electrodes to erode away steel to the shape of the electrodes. This is done under an oil solution which is recycled through filters on the machine itself.

Dear Mr. Kelly:

RE: Industrial Establishment: Charter Tool Co., Inc.
Location: 624 South Avenue, Garwood Boro., Union County
Block: 21 Lot: 1
ECRA Case #88825
Transaction: Sale of Business
Negative Declaration: By Operator Dated: August 18, 1989

Pursuant to the authority vested in the Commissioner of the New Jersey Department of Environmental Protection (DEP) by the Environmental Cleanup Responsibility Act (ECRA, N.J.S.A. 13:1K-6 et seq.) and duly delegated to the Assistant Director of the Industrial Site Evaluation Element pursuant to N.J.S.A. 13:1B-4, the referenced Negative Declaration is hereby approved. This approval is based upon information provided in your Initial Notice as well as DEP investigation of the site.

Since operations have continued at this location after completion of the transaction, it is recognized that limited quantities of hazardous substances associated with the on-going activities remained on the property. These materials--as specified in your Initial Notice, considered complete by this office on June 12,1989 were acceptable under the under the provisions of ECRA. The subsequent cessation of operations at the above referenced Industrial Establishment will be addressed under an ECRA filing for Triangle Tool.

This approval shall be limited to the above referenced transaction only and shall not restrict or prohibit the DEP or any other agency from taking regulatory action under any other statute, rule or regulation.

Sincerely,

Kenneth T. Hand

Karl J. Delaney, Assistant Director

G Known, Suspected or Likely Releases to the Environment:

Place an X in the appropriate boxes to indicate any known, suspected, or likely releases of wastes to the environment.

☐ Known ☐ Suspected ☐ Likely ☒ N

*To the best of our knowle

Note: Items H and I are optional. Completing these items will assist EPA and State and local governments in locating and asses hazardous waste sites. Although completing the items is not required, you are encouraged to do so.

H Sketch Map of Site Location: (Optional)

Sketch a map showing streets, highways, routes or other prominent landmarks near the site. Place an X on the map to indicate the site location. Draw an arrow showing the direction north. You may substitute a publishing map showing the site location.

Description of Site: (Optional)

Describe the history and present conditions of the site. Give directions to the site and describe any nearby wells, springs, lakes, or housing. Include such information as how waste was disposed and where the waste came from. Provide any other information or comments which may help describe the site conditions.

Section D - Dates of Waste Handling:
Economics Laboratory acquired Magnus Chemical Company in 1964 and operated the plant site from 1964-1971. Magnus Chemical Company operated the site for approximately 25 years prior to that time.

Section F - Total Facility Area:
The underground storage tanks in question are located under a parking lot of approximately 10,000 square feet on the plant site. The tanks had, to the best of our recollection, a total storage capacity of approximately 50,000 gallons.

Signature and Title:

The person or authorized representative (such as plant managers, superintendents, trustees or attorneys) of persons required to notify must sign the form and provide a mailing address (if different than address in item A). For other persons providing notification, the signature is optional. Check the boxes which best describe the relationship to the site of the per... required to notify. If you are ... to notify check "Other"

Re: A.C.P. Trust t/a Bell Factory Terminal
Premises: 502-650 South Avenue
Garwood, NJ
Our File No. 010601

Dear Mr. Cyr:

This confirms our telephone conversation of August 16, 1990 regarding the removal of five underground storage tank ("tanks") by A.C.P. Trust t/a Bell Factory Terminal ("ACP") from the above-referenced premises ("premises").

As we advised you, ACP has retained Environmental Waste Management Associates ("EWMA") as its environmental consultant, to clean out the tanks. After the cleaning is completed, the tanks will be excavated. It is anticipated that the tanks will be removed on either August 22, 1990 or August 23, 1990, depending on when the tank cleaning is completed. We agreed to contact you the day before the tanks are to be removed.

During our conversation we asked why DEP's Bureau of Planning and Assessment was investigating the premises. You advised us that the premises is the subject of a DEP investigation due to the potential of hazardous waste existing at the premises resulting from the former operations of Economic Laboratories Corp. and Magnus Chemical Corporation at the site. DEP is reviewing the property to

Re: A.C.P. Trust t/a Bell Factory Terminal
Premises: 502-650 South Avenue
Garwood, NJ
Our File No. 010601

Dear Mr. Cyr:

This confirms our telephone conversation of August 21, 1990 regarding the removal of five underground storage tank ("tanks") by A.C.P. Trust t/a Bell Factory Terminal ("ACP") from the above-referenced premises ("premises").

As you know, the fuel oil underground storage tank ("tank") and the gasoline underground storage tank ("tank") were removed from the premises on August 20, 1990. Present at the time of removal was Deborah Ford of the New Jersey Department of Environmental Protection ("DEP") Metro Field Office. At the time of removal, the tanks were found to be in good condition, with no evidence of any leakage or discharge.

This also confirms that the tanks containing cresylic acid and potash will be removed on August 28, 1990.

In line with your request, here is a copy of ACP's Underground Storage Tank Registration Questionnaire, the Standard Reporting Form for the removal of the tanks submitted and the Registration Certificate pertaining to the five tanks.

Re: A.C.P. Trust t/a Bell Factory Terminal
Premises: 502-650 South Avenue
Garwood, Union County, New Jersey
Our File No.: 010601

Dear Mr. Cyr:

This confirms our telephone conversation regarding the soil waste classification analysis performed on behalf of our client, A.C.P. Partnership ("ACP"), by Environmental Waste Management Associates ("EWMA"), ACP's environmental consultant for the soil excavated during the underground storage tank removal at the above referenced premises.

As you know, the underground storage tanks were removed pursuant to the then-applicable federal underground storage tank regulations. A site assessment was performed which involved visual inspection of the underground storage tanks as well as the excavation. You, Debra R. Ford of DEP's Metro Bureau of Regional Enforcement, Division of Water Resources and representatives of EWMA inspected the underground storage tanks and the excavation. The tanks were found to be in good condition and there was no evidence of leakage. Therefore, no soil samples were collected, and no such sampling was required pursuant to the law.

Waste classification samples were collected and analyzed for soil disposal. Here is a copy of the Analytical Data Report for the waste classification and analysis. The analysis was performed by Integrated Analytical Laboratories, Inc., a New Jersey certified laboratory. Based upon the waste classification results, the soil was disposed of as a RCRA non-hazardous material. As we advised you, the excavations were backfill with clean soil and then paved over.

ATTACHMENT U-1

FARER SIEGAL FERSKO
A PROFESSIONAL ASSOCIATION
ATTORNEYS AT LAW

Given the fact that the site assessment confirmed that no leaks had occurred from the underground storage tanks, no further work should be required. No groundwater was encountered during the excavation. Therefore, we ask that you confirm to us that the matter has been closed.

If you have any questions, please contact us.

TABLE OF CONTENTS

ATTACHMENT U-4

INTEGRATED ANALYTICAL LABORATORIES, INC.

QUALIFIERS

U - Indicates the compound was analyzed for but was not found.

J - This indicates an estimated value. The compound was detected at a value below the minimum detection limit and greater than zero. For GC/MS procedures the mass spectral data meets the criteria required to identify the target compound.

B - Indicates the analyte was found in the blanks and in the sample. It indicates possible sample contamination and warns the data user to use caution when applying the results of this analyte.

D - Indicates the surrogate was dulited out and not detected.

All values are corrected for original sample size and percent solids.

LDL - Lower Detection Limit (of the instrument/method)
MDL - Method Detection Limit
DF - Dilution Factor

UNDERGROUND STORAGE TANK REGISTRATION QUESTIONNAIRE

Bureau of Ground Water Quality Management
Underground Storage Tank Section
(609)984-9736

MAR 0 1 1990

JUL 2 2 1987

COMPLIANCE WITH THIS REGISTRATION WILL MEET ALL REGISTRATION REQUIREMENTS OF THE FEDERAL LAW, P.L. 93-616, THE HAZARDOUS AND SOLID WASTE AMENDMENTS OF 1984, SUBTITLE 1, SECTIONS 9001-9010.

General Facility Information

1. Facility name: ACP TRUST T/A BELL FACTORY TERM.
2. Facility location: 5021 TO 1651 SOUTH AVE
   NUMBER AND STREET
   GARWOOD
   CITY OR MUNICIPALITY
   UNION — COUNTY; NJ — STATE; 07027 — ZIP CODE
3. Owner's mailing address: 1611 VAUXHALL RD
   NUMBER AND STREET
   UNION
   CITY OR MUNICIPALITY
   UNION — COUNTY; NJ — STATE; 07083 — ZIP CODE
4. Owner's name: ACP TRUST
5. Contact person (Facility Operator) ALFRED CHARLES PISCITELLI
   PERSON OR TITLE
6. Contact telephone number: 201 — AREA CODE; 688 — EXCHANGE; 9109 — NUMBER
7. Total number of facility underground storage tanks: 0021 (Complete Questions 12 thru 33 for each tank)
8. Total facility underground storage tank capacity (gallons): 037850
9. Type and status of owner (mark all that apply).

A. ☐ CURRENT B. ☐ FORMER C. ☐ STATE OR LOCAL GOVERNMENT D. ☑ PRIVATE OR CORPORATE E. ☐ OWNERSHIP UNCERTAIN F. ☐ FEDERAL GOVT. (GSA FACILITY I.D. NUMBER)

10. Two copies of a site plan are submitted with this registration. A. ☒ YES B. ☐ NO

Submit two (2) copies of SITE PLAN showing facility or property boundary, buildings and the location of ALL underground storage tanks. EITHER, an existing engineering site plan, if available, OR a neat and legible hand-drawn sketch of the site may be submitted. In either case the site plan or sketch MUST show the location and distances that tanks, buildings, and dispensers are from the facility's property boundary. Include all tanks that are operating or existing, (E); abandoned, (A); or closed, (C). Each underground tank on the site plan or sketch shall be numbered in accordance with the instructions for question 12. The number assigned to a tank on the site plan or sketch MUST match and be identical to the tank identification number assigned to that tank on this form.

INCLUDE FACILITY NAME, OWNER'S NAME, FACILITY ADDRESS AND TELEPHONE NUMBER ON ALL SITE PLANS.

ATTACHMENT W-4

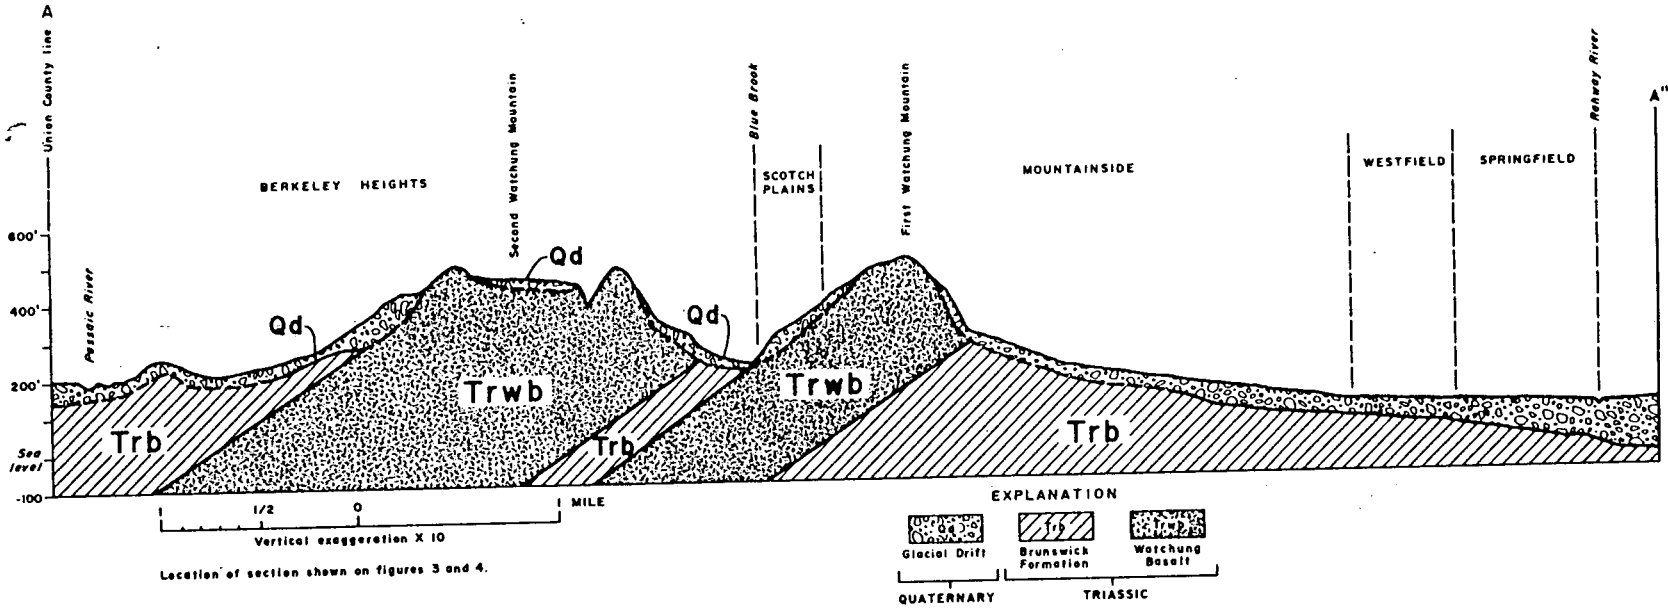

FIGURE 5.--GENERALIZED GEOLOGIC SECTION ACROSS UNION COUNTY, NEW JERSEY.

ATTACHMENT W-5

The Brunswick Formation consists of thin-bedded shales, mudstones, and sandstones which range in color from reddish-brown to gray. The reddish-brown color originates from reworked hematite which comprises 5 to 10 percent of the formation (Boch, 1959). The minerals of the Brunswick Formation include quartz, illite, muscovite, feldspar, and small amounts of calcite and gypsum. Primary structures such as ripple marks and mud cracks indicate that the Brunswick Formation was deposited in a shallow-water environment.

The regional strike of the Brunswick Formation in Union County is N50°E with dips 9° to 13°NW. The major joint sets strike approximately N45°E and N75°W and both sets have a vertical dip. The thickness of the formation is 6,000 to 8,000 feet.

The Watchung Basalt consists of three extensive basaltic lava sheets that are intercalated with the sedimentary rocks of the Brunswick Formation. The basalt flows are more resistant to erosion than the shales, mudstones, and sandstones and form prominent ridges. Two of the three lava sheets occur in Union County and form the First and Second Watchung Mountains. The third sheet forms a discontinuous ridge known as Long Hill and Hook Mountain in Morris County to the west of Union County.

The basalt flows are volcanic extrusive rocks which were formed by the outflow of lava onto the land surface. Rapid cooling of the flows produced a dense, aphanitic rock. Phenocrysts are present in the ground mass which give the basalt a porphyritic texture. The phenocrysts are usually augite and in some cases feldspar. The ground mass for the most part consists of augite and feldspar.

The basalt sheets vary in thickness from less than 300 feet in parts of the Long Hill flow to a maximum of about 1,200 feet in parts of the Second Watchung Mountain. The Second Watchung Mountain is a double flow sheet separated by a thin section of the Brunswick Formation. The thickest flow sheet is the upper flow of the Second Watchung Mountain which has a maximum thickness of about 800 feet.

Quaternary Deposits

Unconsolidated sediments deposited by glaciers or by glacial meltwater during the Pleistocene Epoch mantle the bedrock surface in Union County. These deposits consist of clay, silt, sand, gravel, and boulders. They are glacial, glaciolacustrine (deposited by glacial meltwater in lakes), or glacial fluvial (deposited by glacial meltwater in streams) in origin.

The Pleistocene sediments fall into three general classes: (1) end moraine--a moraine jointed across the course of a glacier at its farthest advance; (2) ground moraine--the material carried forward in and beneath the ice and finally deposited from its under surface; and (3) stratified

drift--deposits from glacial meltwater exhibiting both sorting and stratification. The stratified drift includes lacustrine (deposited in lakes) and fluviatile (deposited in streams) sands and clays.

Figure 3 is a surficial geologic map of Union County showing the extent of the end moraine, ground moraine, and stratified drift. West of the end moraine near Scotch Plains and Plainfield, stratified drift forms an outwash plain (fig. 3).

Before the last glaciation the rivers draining Union County cut deep valleys into the Brunswick Formation (fig. 2). Subsequently the valleys were filled and buried by glacial material. The thickness of the glacial deposits is controlled largely by the underlying bedrock topography. Figure 6 consists of three sections showing the altitudes of the bedrock valley floor and thickness of Pleistocene deposits in the bedrock valleys. These buried channels underlie parts of Hillside, Union, Springfield, Clark, and Scotch Plains Townships, and the Boroughs of Mountainside, New Providence and Kenilworth and the Cities of Summit and Rahway.

The Pleistocene sediments in the bedrock channels consist of unstratified and stratified clay, silt, sand, and gravel. Only the sand and gravel deposits of the stratified drift will yield large quantities of water to wells.

Deposits of Holocene (Recent) age cover only small areas and include river alluvium, and eolian deposits.

The stratigraphic units in Union County and their geologic and hydrologic characteristics are given in Table 1. Table 6 contains representative well logs indicating the variations in the lithologies of the geologic units.

GROUND WATER HYDROLOGY

Introduction

Water is continually being exchanged in a circulatory pattern between the earth and the atmosphere. In general, the amount of precipitation ultimately determines the amount of water available for man's use. Some of the precipitation that falls on land evaporates where it falls, some is absorbed by plants that later transpire the water back to the atmosphere, some flows overland to streams, and some infiltrates into the ground to become ground water. The ground water is discharged to streams, and streams flow to the oceans where the water can be evaporated back to the atmosphere.

TABLE 1.—STRATIGRAPHIC UNITS IN THE RAHWAY AREA AND THEIR GEOLOGIC AND HYDROLOGIC CHARACTERISTICS

Period	Epoch	Unit	Geologic characteristics	Hydrologic characteristics
Quaternary	Recent	Alluvium	Muds and sands deposited in river channels and estuaries; 0 to 50 feet thick.	Muds are relatively impermeable and serve to retard seepage between rivers and the ground-water reservoir, and most important, to retard flow of saline water through river beds.
		Eolian deposits	Sand, white, forming dunes along the Arthur Kill. Less than 10 feet thick.	Deposits lie above water table but transmit water readily to underlying sediments because of high infiltration capacity and permeability.
	Pleistocene	Till	Clay, sand, and gravel, reddish-brown, unstratified, and unsorted. Forms most of the surficial ground and terminal moraine deposits; 0-100 feet thick. Deposited directly by glacier.	Not an important source of ground water because of low permeability and small thickness which lies below the water table. Yields water to dug domestic wells.
		Stratified drift	Sand and gravel, sorted and stratified, occurring as fill in bedrock channels and interbedded with till in the terminal moraine; 0-50 feet thick. Deposited by water.	Important as an aquifer only in the city of Rahway where wells tap both the Brunswick Shale and stratified drift and induce recharge from the Rahway River. Average well yield 370 gpm. Quality of water is good.
		Pensauken Formation	Sand and gravel; chiefly quartz. Some pebbles and cobbles of shale, sandstone, quartz and crystalline rocks.	Yields no water to wells.
		Unconformity		
Cretaceous	Late Cretaceous	Raritan Formation: Sayreville Sand Member	Sand, fine to coarse, white, micaceous; contains clay and arkosic sand beds. Locally crossbedded. 0-40 feet thick.	Not an important source of water north of the Raritan River as much of it lies above the water table. At Sayreville, N. J. the specific yield ranges from 32 to 39 percent and the coefficient of permeability ranges from 30 to 500 gpd per sq. ft.
		Raritan Formation: Woodbridge clay	Upperbeds — clay, black lignitic; contains siderite, pyrite, and interbedded sand lenses. Lowerbeds - clay, varicolored and locally sandy. Total thickness 0-60 feet.	Confining bed.
		Raritan Formation: Farrington Sand Member	Sand, fine to very coarse, light colored; contains interbedded arkosic sand and clay. 0-80 feet thick.	Yields moderate amounts of good quality water. Average transmissibility 10,000 gpd per ft. Average well yield is 96 gpm. Salt water encountered in wells adjacent to the coast. Permeabilities at Parlin, N. J. range from 210 to 3,500 gpd per sq. ft. Specific yield ranges from 25 to 36 percent.
		Raritan Formation: Raritan fire clay	Clay, varicolored blue, brown, gray, or red. Reddish-brown at basal contact with Brunswick Shale. 2-35 feet thick.	Confining bed.
		Unconformity		
Triassic	Late Triassic	Newark Group: Igneous intrusive	Buried diabase sill in southeastern part of report area that forms Palisades where it crops out on Staten Island.	Dense and relatively impermeable. No wells tap the sill.
		Newark Group: Brunswick Shale	Shale, reddish-brown, fractured; contains interbedded sandstone. Underlies glacial drift and Raritan Formation in the Rahway area. Altered to hornfels adjacent to diabase. 6,000 to 9,000 feet thick. Strikes N. 50° E. Dips 9-12° NW.	Most intensely developed aquifer in area. Yields small to moderate quantities of water from primary openings in sandstone and from secondary openings which decrease with depth in shale and sandstone. Water locally high in sulfate, total dissolved solids, and hardness. Both water table and artesian conditions exist. Interference is greatest between wells aligned along strike of formation. Average transmissibility 16,000 gpd per ft. Yield range 2 to 660 gpm. Average yield 75 gpm. Saline water encountered at depth (800 ft) and adjacent to the coast.

Re: Compliance Evaluation Inspection
Elizabethtown Water Company
P.W. ID No.: 2004002
Plainfield/Union County

Dear Mr. Sadowski:

A Compliance Evaluation Inspection of your facility was conducted by a representative of this Division on March 25, 26 and 27, 1991. A copy of the completed inspection report form is enclosed for your information.

Your facility received a rating of "CONDITIONALLY ACCEPTABLE" due to the following deficiencies:

1. During the inspection numerous well deficiencies were observed. Appendix I lists the well deficiencies. Across the top are numbers which correspond to the Well Reference Numbers listed on Attachment A. Along the left margin are the requirements for the wells. A "NO" response indicates where a well was found to be deficient.

2. Appendix II lists pump station and treatment plant deficiencies observed during the inspection.

3. Appendix III lists storage deficiencies observed during the inspection.

NOTE: While many of the deficiencies noted above are the result of regulatory changes enacted after the construction of the facilities, a primary objective of these regulations is to ensure that the potable water facilities are maintained in a safe manner which will provide optimum water quality and, therefore, these deficiencies should be corrected.

Dear Mr. Wagner:

Re: Compliance Evaluation Inspection
Elizabethtown Water Company
P.W. - ID No.: 2004002
Munic/County: Plainfield, Union County

A Compliance Evaluation Inspection of your facility was conducted by a representative of this Division on June 19 and 20, 1990.

Your facility received a rating of "ACCEPTABLE". A copy of the completed inspection report form is enclosed for your information. Please address any deficiencies noted therein.

1. The Green Brook well NO.10 has been abandoned and is not properly sealed.

Please be advised that pursuant to N.J.S.A. 58:14A-4.1, the owner of any well shall, upon abandonment of any existing well or test hole, so notify the Division and shall effectively seal and fill such wells and test holes in accordance with the rules and regulations of the Division. A well not in operation for three(3) or more years or improperly maintained to prevent contamination may be deemed to have been abandoned.

Questions pertaining to the sealing of abandoned wells should be referred to the Bureau of Water Allocation at the following address or by phone at (609) 984-6831.

Rich Kropp, Chief
Division of Water Resources
Bureau of Water Allocation
CN-029

ATTACHMENT 4-10

NOTE: Undersized mains exist within your system. All new mains and all future replacement of existing mains must be at least 6" in diameter, unless justified by hydraulic analysis and approved by the department.

This Division anticipates your continued cooperation in operating your facilities in a responsible and efficient manner.

Very truly yours,

Christopher Brindle

Re: Compliance Evaluation Inspection
New Jersey American Water Company
P.W. ID No. : 0712001
Millburn/Essex County

Dear Mr. Baxter:

A Compliance Evaluation Inspection of your facility was conducted by representatives of this Division on October 13, 1988. A copy of the completed inspection form is enclosed for your information.

Your facility received a rating of "UNACCEPTABLE" due to the following deficiencies:

1. Continental well, well No. 46, well No. 48, Kelly well No. 4, and Kelly well No. 5 are not equipped with a flow meter as required by N.J.A.C. 7:10-11.4 (q)3.

2. Kelly well No. 4 and Kelly well No. 5 do not have properly sealed well heads in violation of N.J.A.C. 7:10-11.4(L)1.

3. Inadequate storage capacity exists within your system. The New Jersey Safe Drinking Water Act and the Water Management Act, require a finished water storage capacity equal to one day's annual average usage. If you feel that such a requirement is an unnecessary burden on your facility, an application for a storage waiver may be obtained from:

Mr. Barker Hamill, Chief
Bureau of Safe Drinking Water
Division of Water Resources
P.O. Box CN-029
Trenton, NJ 08625

ATTACHMENT 4-27

Since the deficiencies cited are presently, or could in the future, adversely affect the quantity and/or quality of water you provide to your customer, you are DIRECTED to institute measures to correct the deficiencies. A written report concerning specific details of the remedial measures to be instituted, as well as an implementation timetable, must be submitted to this Division within thirty (30) calendar days of the date of this correspondence.

The New Jersey Safe Drinking Water Act (N.J.S.A. 58:12A-1 et seq.) provides for substantial monetary penalties for violations of the Act.

Failure to comply with the above will result in the initiation of enforcement action by this Department. This shall in no way be construed, however, to indicate any exemption on your part from possible penalties for violations indicated by the Compliance Evaluation Inspection, as stated above.

Please direct all correspondence and inquiries to John Brennan, of my staff, who can be reached at (201) 669-3900 or by letter through this Division.

Very truly yours,

Gloria T. Grant

29. RAHWAY RIVER (INCLUDING THE ELIZABETH RIVER)

Watershed Description

Measured from the headwaters to the City of Rahway, the Rahway River drains an area of 41 square miles, which includes parts of Middlesex, Union, and Essex Counties. The mainstem, 24 miles long, flows from Union into the Arthur Kill near Linden and is tidal from the Pennsylvania Railroad bridge at Rahway down to the mouth. This is a densely populated area, with the centers of population being Rahway, Woodbridge, Clark, Springfield, Cranford, Westfield, and Kenilworth. Major tributaries to the Rahway River include the East Branch Rahway River, Woodbridge River, and Robinsons Branch. The major impoundments are the Middlesex Reservoir, Orange Reservoir, Lower and Upper Echo Lakes, and Diamond Mill Pond. The Elizabeth River is 11 miles long, much of it being channelized for flood control purposes.

Land uses in these watersheds are residential, commercial, industrial and other uses. There are 53 NJPDES permitted discharges identified in the Rahway and Elizabeth watersheds, all except 5 are industrial/commerical. The waters of the Rahway and Elizabeth Rivers and tributaries have been classified FW-2 Nontrout, SE-2, and SE-3.

Water Quality Assessment

Routine water quality monitoring is performed at three locations on the Rahway River: the West Branch at West Orange, near Springfield and at Rahway. The Elizabeth River is monitored at Ursino Lake in Elizabeth. The Rahway River has fair water quality along its length with generally improving conditions in the downstream direction. The Elizabeth River is severely degraded, especially during the early summer period.

The West Branch Rahway River has fair overall quality with conditions approaching poor quality in late summer. Fecal coliform, total phosphorus, and total dissolved solids are found at problematic levels. Fecal coliform counts had a geometric mean of 1445 MPN/100ml from 1983 to 1987 with 85 percent greater than 200 MPN/100ml. Total phosphorus has averaged .11 mg/l from 1983 to 1987, during which the majority of samples exceeded State criterion. Total dissolved solids have averaged 364 mg/l, among the highest of all monitoring stations in the State. While dissolved oxygen concentrations appear adequate, saturation occasionally falls below 80 percent in the fall.

Near Springfield the Rahway River has its worst monitored water quality. Although overall quality is considered fair, it is poor during late spring/early summer. Excessive fecal coliform and total phosphorus concentrations are found at this location. Periodically, low dissolved oxygen along with high total dissolved solids measurements also occur. Fecal coliform counts had a geometric mean of 1352 MPN/100ml near Springfield, while total phosphorus concentrations averaged around the .1 mg/l criterion for flowing waterways. Occasionally high inorganic nitrogen was also detected. Dissolved oxygen saturation averaged only 74 percent near Springfield, with low dissolved oxygen concentrations often below 4.0 mg/l during early summer. At Rahway conditions are improved over what is found near Springfield. Fecal coliform and total phosphorus are still excessive, but levels are, for the most part, lower. Fecal coliform had a geometric mean of 538 MPN/100ml with 70 percent above State criterion. Solids continue to be present at high concentrations on a periodic basis.

The Elizabeth River drains highly developed urban lands adjacent to the Rahway watershed. Water quality in the Elizabeth River is fair to poor with very poor conditions in May to July. The river, channelized in sections, has fecal coliform concentrations which averaged 13154 MPN/100ml from 1983 to 1987 and excessive phosphorus and nitrogen. Total phosphorus was above State criterion in 61 percent of the samples, while inorganic nitrogen was excessive in

ATTACHMENT 2-2

one-third of the measurements taken. Dissolved oxygen saturation often exceeds 120 percent during summer months indicating elevated primary productivity. Total dissolved solids have also occurred at elevated levels, averaging 435 mg/l during the period of review.

The warm water fish community of the Rahway River has been evaluated by the New Jersey Division of Fish, Game, and Wildlife as moderately degraded. Morses Creek and the Elizabeth River are judged to be containing degraded fish communities; few fish are reported to be able to survive in either waterway.

Problem and Goal Assessment

Point Source Assessment

Water quality of the Rahway and Elizabeth Rivers are reflective of urbanized streams. The presence of high nutrients, fecal coliform and biochemical oxygen demand is thought to be from nonpoint sources and municipal/industrial point sources. Both the Lower Elizabeth and Rahway Rivers have combined sewer overflows discharging during storm events, however the impacts are most severe in the Elizabeth River. There are 16 Department enforcement actions against discharges that are impacting water quality in these two watersheds. They range from facilities not meeting permit limitations to raw sewage discharges. Hazardous wastes sites are present in these watersheds, but none have been identified to be contaminating surface waters. In the lower tidal sections of the Elizabeth and Rahway Rivers water quality is reduced because of boundary conditions (i.e., Arthur Kill water quality).

Nonpoint Source Assessment

The Rahway River watershed is highly urbanized and its waterways are severely degraded both by nonpoint source pollution and by the physical alterations which extensive urbanization has brought about. In addition to pollution and habitat destruction, flood control has been a major problem in this watershed. Known sources of nonpoint pollution in the Rahway River include construction activities, storm sewers, urban surfaces, roads, and combined sewer overflows; all of which have contributed to high stream temperatures, sediment and nutrient loadings, periodic low dissolved oxygen levels, and fishkills. Another problem in this watershed is landfill leachate which is believed to have contributed to the degradation of the tidal Rahway River, as well as to the adjacent Arthur Kill, Marshes Creek, and Kings Creek.

Morses Creek and the Elizabeth River, draining almost totally developed watersheds, have been extensively channelized. Both are judged to support minimal fish life due to the combined effects of habitat loss and severe water pollution levels coming from numerous nonpoint and point sources. The Elizabeth River has been described as chronically polluted over its entire length.

Designated Use and Goal Assessment

The Rahway and Elizabeth Rivers are not of swimmable quality. Severe pollution of the Elizabeth River along with channelization combine to cause a degraded fish community in the river. Therefore, the freshwater Elizabeth River is classified as not achieving the fish propagation/maintenance use and goal. The freshwater Rahway River is considered to be partially meeting the fish propagation/maintenance use because of a moderately degraded fish community. Designated use attainment (which is generally less than the swimmable/fish propagation goal) in the tidal portions of both rivers is not known because of a lack of water quality information.

Monitoring Station List

NATURAL HERITAGE INDEX MAPS

The Natural Heritage Database contains several thousand records of individual occurrences of endangered and threatened species and ecosystems. Many of these occurrences either have not been documented in recent years or have not had habitat boundaries delineated. Because much work remains to be done to delineate habitat boundaries and determine current status for these occurrences, Natural Heritage Index Maps were devised to red flag general areas in which the occurrences are located. The index maps are meant to be used as a tool to point to areas which may be of significance for endangered biological diversity. These maps do not depict all endangered species habitat in the State, but merely general areas which contain documented occurrences. Many additional areas may contain unidentified or poorly documented occurrences.

The maps have been produced using a computer generated grid which shades a grid cell approximately 330 acres in size if an endangered or threatened species or ecosystem has been documented anywhere within the cell. To use these maps, we suggest that you first find the location to be checked on the quad maps and then refer to the same grid location of the Natural Heritage Index Maps. The Natural Heritage Program can be contacted for additional information as specific projects are planned.

COMMENTS ON HABITAT ASSOCIATIONS

In Pennsylvania, Bog Turtles found primarily in sphagnum bogs or wet sedge meadows in or near slow moving streams with a muddy bottom, above 610 meter elevation. The highest populations occur in shrub stage of forest succession. *3073*

In Maryland, Bog Turtles were associated with spring-fed pockets of shallow water, a bottom substrate of soft mud and rock, dominant vegetation of low grasses and sedges, and interspersed wet and dry pockets. Turtles were never encountered beyond the wet meadow transitional edge. This habitat wa used for all activities, including mating, foraging, egg-laying, basking, resting, and over-wintering. *17*
